For Christ sakes, Peter! Apple has been in decline since Steve Jobs
left the company. People were saying the same thing when John Scully
came on board. Apple is in trouble. The current leadership is NOT
a guarantee that Apple will be around "past our lifetime". It's
marketshare continues to wither away.

BTW, Peter, my Uncle at EDS just told me that their graphics departments
are going 100% PC. Yes, Peter, EDS is going to drop most of their Macs.
Another big blow, and no doubt you'll come up with some sorry-ass
denial for it.

>MacMall chain has Power and Supermac/Umax..

This is all you can come up with!? Pathetic, completely pathetic. You
didn't even refute his argument, in fact, you SUPPORTED it even more
by coming up with this lame example. You are hopeless!!!

> inhabits newsgroups. Think about it for a moment...

We could probably even come up with a simple program to explain the
Pinhead virus. I submit some pseudocode:

```
Pinhead.Sinclair-Day.Virus (any calling parameters?)

if is_woman(original_poster)
then
attempt_really_lame_pick-up_line
else

x = random number (1 to 5)
case x of:

1: post(quote_whole_article, add("Dumbass") )
2: post(quote_whole_article, add("So you have a weasel?") )
3: post(quote_whole_article, add("You are batting -1000..") )
4: post(quote_whole_article, add("And you?") )
5: post(quote_whole_article, add("MacMall chain carries Apple..") )

Add more for complete number of his possible responses

end case

end
```

It doesn't take much to describe all of Peter's logic, does it?

/Kevin

Can anyone advise? Atari is still the best for music (so I'm told).
A) Does 4 meg add to its MUSICAL capability?
B) What are the top software packages you might still be able to get hold of?
C) What would your shopping list look like if you were starting from scratch and were only interested in the music? (Mono screen fine.)
Any help appreciated.
Stuart

Hi Brian,

Brian-Roland Miller (brimiller@delphi.com) wrote:

: I'd imagine too that it's quite embarrassing for Peter to realize that there
: are more TOS clone makers than Mac clone makers, and that development of the
: OS has continued, and will continue long past the death of the Atari name.
: TOS has become (via MagiC) the first viable, affordable, multiplatform OS -
: long before PPCP/Copflop hit the streets.
: ---
Well, the term *multiplatform* sounds a bit exaggerated to me. OK, the MagiC
OS is being emulated by Macs well enough, granted. But that's because the
Mac uses the same CPU, only faster ones because of the MacOS's slowliness,
and the PowerMac is (and needs to be) well-equipped to emulate a Mac.
Lucky thing for Atarians in search of a new platform. Imagine we'd have
to make do with PCs -- MagiCPC reaches ST speed on a P75.

Now, don't you agree Macs are *beautiful*??? ;-)

BTW, is anyone porting MagiC(Mac) to the BeBox or planning to do so?
I saw one last week, and I saw a possible new home for all Atarians
instead of slow, dumb Macs and slower, dumber PCs :-)))

: Apple's legacy shall be to be remembered as the company who stayed afloat by
: selling overpriced hardware to government buerocrats like Sinclap, who didn't
: need justification for $10K+ expenditures.

True, perhaps, but this am Atari country, son. And you
don't have no horns... ;-) Which is to say, we have the right to
be fanatical about Atari gear here, and also to flame, to the Sun
and back, anyone who does not bow to the mighty Fuji. Well, perhaps
I'm not that bad, but the detractors make it sooo easy to outright
love my Atari gear. Heck, why not!

> Put away this flame war. It is getting lame. It is like two men on
> the Titanic debating over the color of the paint in the hallway.

I thought that was the Posidon [sp?] Adventure. Besides,
I'm making an effort to do follow-ups to comp.sys.atari.advocacy,
so you need not get your panties in a bunch. Better yet, kill
file me and Peturd, and you'll not have to waste your time with
our flame-fest. But you'll be missing out on some superior flaming,
and Peter is just damn funny to interact with. It's like squirting
a mad dog through a chain-link fence. Lots of snarling and barking,
and fleas, but *we're* the ones having a good time of it. I say,
enjoy Peter while he lasts...

I took a look, and I'm scared, *REAL* scared. What's the stock
at these day? I'm too afraid to look. That money is *GONE*, pally.

The secret word for this week is... "dumbass" write it down.
Or if you're Peter, rite it down..

> MacMall chain has Power and Supermac/Umax..

MacMall? Who the hell is that? I think they're a catalog,
aren't they? You should buy from MacWarehouse, they have better
looking waitresses.

> GREETINGS..

Greetings, and salutations, Mr. Dumbass. What a dumbass.
Are you a dumbass much? Is dumbass your favorite word now? I'm
thinking, since U wurk in a libararary, that you may have noticed
a thing call a dictionary. It has more words in it for you to use.
And when you're up to speed you can try a thing called a thesaurus.
[sp?] That has words you can use when you have used the same word
over and over, and you're begining to look like, well, a dumbass,
dumbass.

How's that, dumbass? I used dumbass eight times in my reply...
how many can you do Peter? ;-) Oh wait, that was nine.

Well, I'm to blame for the subject lines, and I'll take full
credit for them, as I love to change them, for entertainment and a
Peter reaction. However, if you have a better idea on where I can
follow-up Peter ridiculous posts, please let me know?

> Yeah... but just one question: What the hell is everyone so frustrated about
> that they need to have a flamewar? I thought Atari users aren't frustrated.
> Or do you all have Windozes or Macs at work?

No frustration. We don't like Peter in the regular Atari
videogame realated newsgroup, so we chase him over to here. He
fails to provide facts to back up his claims and, as Kevin says,
he's been here for 2 1/2 year doing the same thing. You can ignore
him, or confront him. I choose the latter. If it frustrates you
to read our insulting replies, again, tell us where to go, or kill
file the lot. There will be no real discussion. Hence I, and others,
chase him here.

I think they are. Again, kill file it.

> You might give proof to what is wrong with them, or
> failing that you might give reason what you think is wrong with them.
> But if you start insulting, the thought appears that you don't have any
> arguments to put against his either.

It's been done, repeatedly. It does not work. This won't
either, but I'm having fun doing it, and if you are not a fan of it
then I *URGE* you to not pay attention to it, and kill file it.

> Hmm... well, I can't really say, but if that is so, then why didn't you

No, that's called Usenet Entertainment(TM). If you're not a
fan, go kill file it. And as for email, Peter himself lost an
account for "emailing" someone 400 times. Please, if you're not up
on the history of this, stay out of it.

From personal expirence, both Synopsys and The 3DO Company
are hooking the Macs, and going PC. Everyone is doing it! Why
can't we?! ;-) BTW I am a multi-Mac owner, and a crApple shareholder...
please pray for me.

So where are these TOS clones? How come I can't find a full color double
spread add? Why are these clone firms selling yeasterdays technology? Why do
these new yesterday clones cost more than the $1899 PowerComputings PPC
604-120mhz PowerCenter with a cpu daughterboard?

Well, you've already yourself admitted that you haven't been paying
attention, don't care and that you aren't familiar with the content or nature
of Petey's posts.

If you payed better attention you might no be so 'perplexed'.

You also may have noticed that the 'Slam-subjects' directed at Petey
originated as demands for support and examples for threads he originated.

>shit as well. OK, maybe he is of a different opinion than you, and OK
>maybe his arguments are nonsense and objectively wrong (I don't say they
>are, I say they may be), but reactions like yours are *not* the way to
>deal with such. You might give proof to what is wrong with them, or

When rational discourse fails, there is no point in maintaining
civility. It is wasted effort.

Also, burden of support falls on the one who asserts. (namely Petey)

>failing that you might give reason what you think is wrong with them.
>But if you start insulting, the thought appears that you don't have any
>arguments to put against his either.

See, there you go not paying attention again. Rational discourse has faded on all sides. It's now a flamewar proper. There are no 'arguments' any more. Catch up already...

The second day in a row I login, and I don't see any fresh posts from the Sinclapper.

Has he finally gotten the point? Has he finally realized that his spew is not wanted here?

No doubt, just like some fungus, he'll return someday. But maybe we have won some peace for a while. If so, I will be definitely enjoying whatever respite we get from Sincrap.

/Kevin

Probably a system crash. I assume he is like many MacLosers in being
totally clueless as to the real inner workings of his computer... After
he wastes $200 at an authorized Apple service center for some dope to
tighten a screw he'll be back with us...

Note Mac people, I said many, not all....which in my experience is 100%
true.

Did ya learn a new word in school today, Peter?? Did the teacher write
"dumbass" in big blue letters on the chalkboard for you and the other kdis
in the SpecialEd class?? You've been using it quite alot the last few
days...you must be so pleased to be expanding your vocabulary. Maybe one
day teacher will teach you how to quote a message without quoting
irrelevant information and how to cut down your corn-fed liberal puking
macloser sig. But until then go back to naptime. Who is running that
liberal sham mailing list?? It can't be you as you're not nearly bright
enough to engineer something like that. Go shuck some corn, fuckchop.

Hi Bruce,

Bruce Haire (haire@engr.sgi.com) wrote:
: [Erik, that's me, wrote:]
: > Oh well... some of what I've seen replied to Pete's messages didn't quite
: > impress me as being all too intelligent either, let alone the titles of
: > most of the threads here. And yes, I *do* mind. comp.os.ms-windows.
: > advocacy is a more civilized place than this. :-(((

: Well, I'm to blame for the subject lines, and I'll take full
: credit for them, as I love to change them, for entertainment and a
: Peter reaction. However, if you have a better idea on where I can
: follow-up Peter ridiculous posts, please let me know?

Hmm... in the de.* hierarchy, we have a de.alt.flame group for precisely
these purposes, certainly there is something like that outside de.* too?

: > Yeah... but just one question: What the hell is everyone so frustrated about
: > that they need to have a flamewar? I thought Atari users aren't frustrated.
: > Or do you all have Windozes or Macs at work?

: No frustration. We don't like Peter in the regular Atari
: videogame realated newsgroup, so we chase him over to here. He
: fails to provide facts to back up his claims and, as Kevin says,
: he's been here for 2 1/2 year doing the same thing. You can ignore
: him, or confront him. I choose the latter. If it frustrates you
: to read our insulting replies, again, tell us where to go, or kill
: file the lot. There will be no real discussion. Hence I, and others,
: chase him here.

How can I killfile with tin on HP-UX? No-one here seems to know...

: > but reactions like yours are *not* the way to
: > deal with such.

: I think they are. Again, kill file it.

Well, I think they might well be in some *.flame newsgroup, but I do not
feel that way at all in an *.advocacy group (except maybe comp.petey.advocacy)
;-)))

: > You might give proof to what is wrong with them, or
: > failing that you might give reason what you think is wrong with them.
: > But if you start insulting, the thought appears that you don't have any
: > arguments to put against his either.

: It's been done, repeatedly. It does not work. This won't
: either, but I'm having fun doing it, and if you are not a fan of it

: then I *URGE* you to not pay attention to it, and kill file it.

Hey, don't be offended. I'm no one to tell you what you should do.
If most of the folks here feel that it's not the group for Atari attacking
and defending, but for Mr Sinclair-Day bashing, then tell me, everyone,
and I'll go away. But if there are more like me who are unnerved by
the hassle, maybe the right way to go would be transferring the Peter
discussions to another group, or maybe keeping them to one thread in
this group.

: > Hmm... well, I can't really say, but if that is so, then why didn't you
: > try to patiently send an *email* to him in which you state why he is a
: > fungus *each time* he was one? Simply posting a followup saying "you're
: > a piece of shit, go away" doesn't exactly serve the purpose of driving
: > someone away, you know. Everyone, when attacked in public, will try and
: > correct the public's image of himself. And voila: you have the next
: > round in this never-ending battle. :-(

: No, that's called Usenet Entertainment(TM). If you're not a
: fan, go kill file it. And as for email, Peter himself lost an
: account for "emailing" someone 400 times. Please, if you're not up
: on the history of this, stay out of it.

I said in the beginning I'm an outsider and wanted to put things in
perspective. Could you please keep this discussion to one thread
so that in the others there can be an Atari vs. anything discussion?
That would be great enough...

: > Greetings,

: Greetings?! I don't like to sound of that.

I'm sorry, what's so bad about that? I'm from Germany, I don't know
the "sound" it might have to you. I didn't mean anything in particular
by that. If it sounded wrong in any way, I wish to apologize.

Yours,
Erik Meltzer

Hi Erik,

Yes, I agree with your feelings about the current state
of this group. I was hoping that this would be the correct place
to continue to flame Peter for his illogical need to support Apple
in an Atari group. [Funny, Apple and Atari are in the same boat.]
Anyway, I have no idea how you can use kill files in TIN on HP/UX,
having only a small amount of expirence with that OS. You might
want to check out the Help screen to see if it mentions automatic
message filtering or "kill" procedures. If you were running RN,
that would be another story. ;-) Also, we do indeed have lots
of *.flame groups, but the main reason that Peter responds is
due to the fact that the word "Atari" appears in the name of the
group. He would not follow us down to the flame groups for very
long. He needs Atari to fuel his "fire", if you will. Sorry
if this is detracting to the group's charter, but it does seem
like the best place for it.

> : Greetings?! I don't like to sound of that.
>
> I'm sorry, what's so bad about that? I'm from Germany, I don't know
> the "sound" it might have to you. I didn't mean anything in particular

My mistake... that is the sign-off that Peter himself has
been using, and I thought you may have been referencing it. ;-)
It gave me reason to "take a second look". Don't mind me, I'm
more into the meta-workings of most of the groups I read.

Regards,

-Bruce

Apple sells products dumbass in the tune of over $2billion per quarter. What
part do you not understand?

New Dataquest Study Confirms Apple is No. 1 Worldwide Multimedia PC V (p1 of 7)

Apple Computer
Press Release
June 17, 1996

New Dataquest Study Confirms Apple is No. 1 Worldwide Multimedia PC Vendor for
Second Year in a Row

CUPERTINO, California--June 17, 1996--A recent study by market
researcher Dataquest names Apple Computer, Inc. the No. 1 vendor of
complete multimedia PC desktop systems worldwide for the second year
running, with 18.8 percent of the market. The 1995 worldwide complete
multimedia PC desktop systems shipments were estimated at an
astounding 20.9 million units, slightly more than double the 10.4
New Dataquest Study Confirms Apple is No. 1 Worldwide Multimedia PC V (p2 of 7)
million units shipped in 1994.

Under the leadership of Dr. Gilbert F. Amelio, Apple's new corporate
strategy positions the company in front of the industry's key
"mega-trends": convergence of computers, communications and consumer
electronics; explosive growth in Internet use; and the demand for
media-rich digital content. Apple's proven leadership in multimedia
positions the company well for the future and Apple intends to provide
Macintosh and Mac OS-compatible users with the tools they need to
exploit these trends.

Apple expects to extend this leadership on the desktop to the Internet with our robust interactive media technologies such as QuickTime. QuickTime is Apple's de facto multiplatform industry standard architecture used by multimedia software tools vendors, content creators and production professionals to store, edit and play synchronized video, sound, graphics, text and music through a wide range of media, including CD-ROM and the Internet.

"Apple is committed to continuing to enrich the multimedia experience.
New Dataquest Study Confirms Apple is No. 1 Worldwide Multimedia PC V (p3 of 7)
We will continue to innovate and capture the hearts and minds of our customers and multimedia developers alike," commented Satjiv S. Chahil, senior vice president of Corporate Marketing for Apple. "We're excited about the year ahead: watch for initiatives from Apple that directly and positively impact multimedia developers, consumers and retailers."

The regions outside of North America had the majority of shipments of complete multimedia PC desktop systems for the first time ever in 1995, accounting for 52.4 percent of worldwide shipments, up from 30.9 percent in 1994. These regions include Europe, Japan and Asia/Pacific. The Rest of World regional designation grew a dramatic three-fold from 1.8 percent in 1994 to 6.6 percent in 1995.

"Throughout the world the use of multimedia capable PCs is exploding, double the number of shipments in 1995 from the previous year," said Bruce Ryon, Dataquest's director of multimedia research. "Apple Computer shipped nearly 4 million of those systems, reinforcing Apple's continued leadership in delivering multimedia solutions to the broadest range of customers."
New Dataquest Study Confirms Apple is No. 1 Worldwide Multimedia PC V (p4 of 7)

Apple Computer, Inc., a recognized innovator in the information industry and leader in multimedia technologies, creates powerful solutions based on easy-to-use personal computers, servers, peripherals, software, personal digital assistants and Internet content. Headquartered in Cupertino, California, Apple develops, manufactures, licenses and markets solutions, products, technologies and services for business, education, consumer, entertainment, scientific and engineering and government customers in more than 140 countries.

:> Really? Then why when I asked you to comment on Apple's problems
:> a couple posts back did you reply "They're news to me"? Apparently,
:> not only are you a hypocrite, but a *liar* as well.

:You stated that Apple is screwing up and I stated that is news to me. In what
:way has the new team screwed up?

Peter, Peter, Peter...

I said "I heard that Apple wasn't doing very well" meaning that I had
heard that Apple THE COMPANY wasn't doing very well, not that the new
Apple MANAGEMENT wasn't doing very well. And by "not doing very well"
I meant...wait, do I *really* have to explain what it means for a
company not to do very well?? I don't think that I should have to
explain that to a college graduate, so I won't. Of course, whether
or not you are actually a college graduate is open to question since
you apparently don't even know HOW TO READ!!

So when will you get around to explaining how my r.m.misc posts made
me look like a fool? I'm waiting...

* Tom

Here in New England, we have a term to describe people whose posts are of
this nature. . . "stupid fahka."

>> Besides, Peter says, we always have Mac clone makers if Apple goes kaput.
>> Hmmm... who will develop the OS?
>
>Claris, PowerComputing, Motorola, UMAX/SuperMac, IBM to name a few..

Yep, that assumes that the sale goes through smoothly after liquidation
proceedings. If 1/3rd of Apple's net worth was obsolete inventory that
was written off (as you incorrectly claim), the company probably would
take months to sell off, with creditors holdingup the sale to try and get
a bigger piece of a tiny, shrivelled pie.

>So where are these TOS clones? How come I can't find a full color double
>spread add? Why are these clone firms selling yeasterdays technology? Why do
>these new yesterday clones cost more than the $1899 PowerComputings PPC

I agree that this is not the place to post such advertisements, but what makes it " .. base,immoral, perverted,"? and why are you the authority ? Funny but I have this outmoded notion that consenting adults have the right to do what they want. Has something to do with personal freedom.

: >Do you *have to*? I think you *want to*. I've been reading this group
: >every now and then for about a month now, secretly hoping that it might be

: The content of your post would indicate otherwise.

I beg your pardon? I honestly do not have a clue what you mean to say.

: >I cannot say whether Pete's arguments were or weren't good, and I must say

: Then you really are in no position to critizise; are you?

Hmmm... well, is this newsgroup only for people who've been on it for years?
From its name I suspected that it might be the right place to discuss pros
and cons of Atari computers vs. others, am I wrong? So when I find this
group full of threads whose names are insults to one specific person, I
wonder how come? I haven't got the chance to read the starts of this from
years ago, and I'm in no particular mood hunting through hundreds of
postings quoting each other and adding yet another childish insult, either.

: >that I don't care either... what I want to say is this:
: >Assuming that you are right, and Pete's opinions and arguments are completely
: >and utterly shit -- then what better are you all creating threads with the
: >insults right in the subject? I'd think THAT'S completely and utterly

: Well, you've already yourself admitted that you haven't been paying
: attention, don't care and that you aren't familiar with the content or nature
: of Petey's posts.

I stated that I didn't pay "attention" to your flamewar, yes. I did *not*
state that I didn't care. If I didn't, I would not comment on the topic.
I would unsubscribe the group. I wanted to express the following:
Even *if* his postings are shit, and whether they are or not doesn't matter
for this argument, the way you react to them is *not* better at all.

: If you payed better attention you might no be so 'perplexed'.

Am I perplexed? Hmmm... I'd say no. I'm just wondering whether what goes
on here is the right way to behave in a newsgroup, even *if* it's *.advocacy.
I looked into other *.advocacy groups, namely ms-windows.advocacy, and there
I could find things like "Macs suck" and "Win95 has thrown back IT for years".
Not exactly highly intelligent stuff either, but *lightyears* away from a
flamewar like here. So I posted my thoughts about it, in what I regard as
a polite manner. No need to attack me, I should think?
Again, I could not "pay attention" because I am a newcomer. But is that a
reason to treat me unworthy to express my feelings about the ongoing in this
group?

: You also may have noticed that the 'Slam-subjects' directed at Petey
: originated as demands for support and examples for threads he originated.

Hmmm... do you mean that you (whoever) created a thread for each argument
or opinion of Peter's that you considered wrong? Insulting him as
stupid, in a new thread for each time he maybe was? Cause that's how it
looks like to me.

: >shit as well. OK, maybe he is of a different opinion than you, and OK
: >maybe his arguments are nonsense and objectively wrong (I don't say they
: >are, I say they may be), but reactions like yours are *not* the way to
: >deal with such. You might give proof to what is wrong with them, or

: When rational discourse fails, there is no point in maintaining
: civility. It is wasted effort.

When non-civility fails either, I believe there is no point in maintaining
communication. I believe this is wasted effort then as well.

: Also, burden of support falls on the one who asserts. (namely Petey)

Huh? I don't get you.

: >failing that you might give reason what you think is wrong with them.
: >But if you start insulting, the thought appears that you don't have any
: >arguments to put against his either.

: See, there you go not paying attention again. Rational discourse has
: faded on all sides. It's now a flamewar proper. There are no 'arguments' any
: more. Catch up already...

OK, then could you not agree on leaving the flamewar in one thread, or in as
many as the flamed one creates? I get the feeling that Peter only replies to
whatever insult you come up with against him. And maybe, once in a while,
replies to a post that does not insult him. So the way might be not to insult
him whenever the opportunity arises, but to discuss matters rationally not
with him, but with the other readers of this group, and to keep the flamewar
in one thread. Or maybe to add a "FLAME:" to the subjects of the flame
threads.

I just cannot believe that grown-up persons like you, me, and Peter, can't get
along without rendering a whole newsgroup practically useless. There are
other ways of dealing with ones who are a pain in the ass. Ignoring, for
exapmle. Or, if that fails, complaining to postmaster@his.site. Or, if

that should fail, mailbombing. Or, if that should fail too, killfiling Mr Sinclair-Day. But I don't want to killfile *everyone* here that contributes to Peter-bashing, because I think someone might add useful thoughts to some other discussion here. And, even if you can't believe it, I think Peter might do so too, when given a chance and not brought to rage by insults like yours.

I'm no particular fan of Peter, and some of his comments did strike me as stupid, too... I just don't feel that your reaction to them is appropriate. What I feel appropriate I stated in my original posting, and above. When you have tried all of this, and it didn't work, then why do you overreact like this? Why do you make people feel that "we need a new newsgroup", istead of trying not to waste the old one anymore like you apparently did for the last couple of years?

Yours,
Erik Meltzer

He was skeptical that there was no front store had the clone and I stated otherwise. I will not list all I know...As for your remark, I don't give a shit if none is near you jabba..

I am sure that there are other retailers that would carry the Supermac S900. Why not give UMAX a call and ask for the nearest retailer..... As for me its the catalog/mailorder way..

GREETINGS..

I win, I win!!!! 8-) Nah-nah, I got Peter to reply with an actual
crApple press release, the bigest, and most informative post of
his life! And *I* made him do it! Now roll over, Peter. Sit. Beg.
Good boy! ;-)

PETER SINCLAIR-DAY wrote:
> Apple sells products dumbass in the tune of over $2billion per quarter. What
> part do you not understand?

That should be; Apple sells dumbass products.

[crApple PR deleted, in which the $2 billion was never mentioned]

> I remember that quote and used it proudly. Minter is such a dumbass when i
> told him that his days at Atari were numbered because the Jag flopped the day
> it reached the market..

You are a *real* psy-kick fee-non-min-numb thar, Peter!
Are you predicting that Windows9X will be the standard OS for the
next ten years? You should, 'cus that's where we're *all" going.
Even crApple made a DOS Mac, true it was a sad little thing that
could barely run Windows, but DOS/Win/Intel are in your future.
I have predicted it!
As far as the Great Jeff Minter goes. Well, he creates
products by writing *great* software. He is a contributor to
the industry. You, on the other hand (pun intended), are just
some loser-user. Unable to create, so you just play the critic.
You have *no* skills.

Where's my cheese, Mr. Hip-Democrate man?!

Oh wait... before I go...

Here's the list of words that will replace "dumbass" in the next
few weeks. BTW, Peter stole (uncreative) the word from Beavis and
Butthead...

dumbass [already overused, but that does not bother Mr. Uncreative]
dillhole
butt burgler
butt munch
asswipe
semprini

Thanks, come again!

What does the jag have to do with Macs? From what I read, Wall ST may have
liked the Jag but did question Atari's ability to make the Jag a success.
Apple's current situation is to change their business model to make money not
from a lack of demand of the Mac. Apple sells over $2 billion per quarter...

I dislike certain types of posts as much as some others. They make it very difficult to enjoy the Atari usenet newgroups. One poster's insipidy can quickly depress this helpful and lively group.

The worrisome part of this business is the use of *violent profanity* when discussing childrens educational issues. How does one respond to violent, profane verbal bashing? On the 'net (assuming no one wants their freedom of speech curtailed) the best method is to completely ignore the poster. This is hard to do. Even discussing the poster's actions may only excite him or her the more.

If the issue is improving the lives of children through technology, then we should, at the very least, make the computer help sections of the 'net a fairly safe area for the kids. (Assuming they may want a say in their destiny!)

And, so what if Gary Kildale used the "office analogy" to make GEM so easy to use and it was such a failure in the IBM compatible world and such a hit (with TOS) in the Atari world. And, so what if the Mac mouse only has one button and you have to keep your finger on it when trying to decide just exactly what you want to select from the menu . And, so what if Windows.xx still uses the "tree" directory approach to file management and most people still don't understand it. And, what is Oracle and why do I want to know? Is it really the future. (Didn't want you to think I was limited here.)

Confused in the USA.........

You don't. Once people start using foul language, facts and
understanding go out the door. Best to ignore it, or kill file it,
if you have the option. It is hard to do at first, but with
tollerance comes knowledge that no matter what you try, you can't
change someone's mind for them. Confrontation is best left to
those who enjoy such behaviour.

> If the issue is improving the lives of children through technology,
> then we should, at the very least, make the computer help sections of

> say in their destiny!)

Is c.s.a.a a "help"
section? I thought it was for advocacy
and anti-advocacy of the topic systems and related issues. The net
is just like any other place in our world. It may be dangerous in
some places, and pleasent in others. It is up to the *parents* to
decide for their offspring where to go, and where not to go. If
you mean "safety" from observing "bad" words... I have news for you.
No one can protect their kids from that. It happens at their schools,
in the playground, and anywhere where young minds play. To say that
we must "clean up the net" to "protect the children" is wrong. Let
the parents buy "safe" software to clean up their own screens. I
refuse to live in a child-centered world. If you disagree, then
I will use bad words against you. It's just words. Nothing more.
The Internet is not Disney Land, thankfully.

> And, what is Oracle
> and why do I want to know? Is it really the future.

Well, from watching Triumph Of The Nerds on PBS, it looks to
be something I've always wanted. Full high-speed Internet access
from home (no more wimpy 28.8k) without the need to go down to the
local computer store to buy some bits on a disk in a cardboard box.
Instant OS and App updates via the net. *That* is the future. I
hope. ;-) I thought I would have to plunk down and finally get a
PC. If Larry Ellison turns out to be correct, I can still hate the

PC, and get decent access to info, from home, without feeding Bill Gates' wealth machine. I'm keeping my eye on Oracle...

These are my opinions. Thank you for reading them. Feel free to add your own. It's fun! ;-)

Regards,

So, this example is really rather superfluous. The DTP's could be ripped
away from the kiddies and the only real effect would be to make the teacher's
life harder. S/he would have to deal with script again...

Although general familiarity with DTP programs may be constructive,
it does nothing to further the goals commonly associated with an english class.
Also, for text authoring, it's overkill.

Great example petey-boy.

Emacs could serve the same purpose as well as any other cut/paste
capable text editor on a plethora of platforms.

As a K12 app, it is rather weak. The application is so generic and trivial
wrt to processor power as to make the extra expenditure on newer hardware
quite wastefull.

Actually, I was implying that noone was near YOU. If you had half a brain, some education, & the ability to pay attention you may have noticed that.

Cali. is nowhere near YOU are.

I, however am driving distance away from 7+ metro cities with populations exceeding 1 million. If there are no Mac clones available in these parts, there are quite a few people being left out of Apple's marketing plans. Although this is not altogether unusual [for apple].

This also bears too much similarity to the state of Atari in these parts.
>
>I am sure that there are other retailers that would carry the Supermac S900.

Mailorder eh? Sounds like the mac advocate has no storefront support for the machines he advocates.

So, this example is really rather superfluous. The DTP's could be ripped
away from the kiddies and the only real effect would be to make the teacher's
life harder. S/he would have to deal with script again...

Although general familiarity with DTP programs may be constructive,
it does nothing to further the goals commonly associated with an english class.
Also, for text authoring, it's overkill.

Great example petey-boy.

Petey-boy should be glad that his graduate advisor is not around to see
his [petey's] stupidity.

>What does the jag have to do with Macs? From what I read, Wall ST may have

Assertion: Wall ST acceptance implies a company is viable

Fact: Wall ST approved of Atari immediately after the release of the Jaguar.

Point: Fact contradicts assertion.

Conclusion: Assertion not universally true.

Implication: Assertion may not be true for Apple.

>liked the Jag but did question Atari's ability to make the Jag a success.
>Apple's current situation is to change their business model to make money not
>from a lack of demand of the Mac. Apple sells over $2 billion per quarter...

Atari had it's name and past success as well as quite a bit of lead time.
Yet they did not take advantage of them.
Apple is no less capable of making stupid mistakes. Their current crisis
is an indication of this. New idiots at the top are no guarantee that Apple's
'situation' will improve.

Until their is new evidence to base a conclusion on, we can only use what is present.

What is present is far from promising.

1) You, of course, _realize_ that by responding to this message you
are also crossposting, right?

2) The morality or lack thereof should not be the issue; the issue is
massively cross-posted advertisements of any type, especially those
appearing in inappropriate newsgroups.

3) See news.admin.net-abuse.misc for more on how to combat this spam.

4) Terminate this thread! Give it no more reason to exist. Start a
new one if you must, but this discussion really does not belong here.

Dave Baseley

No, but I wouldn't post one anywhere :) Trying to make all the internet
suitable for kids is what the US government tried to do, and
fortunately didn't manage. There's no way you can prevent kids from
accessing wherever they want on the internet.

I agree that posting it here was totally inappropriate and wrong, but
posting it in say alt.sex would not be inappropriate, yet kids can
read that.

You know, everyone is speaking about the "right" to post anything up on
the Internet. But with that right comes responiblity. You must remeber
that not everyone wants to see this stuff and some should even see this
like children. I do wish people who advertise this sort of thing will
stick to speciality newsgroups instead of broadbasing it everywhere, it's
like that in the real world BTW.

And those who feel that 'they' shouldn't have to be protected because the
children must be, do you let your Playboys out where your kids can read
them? Thought so...

Oh really? How many children have the money to buy their own computers
these days? How many children have accounts with the phone companies or
ISPs?

This isn't a free broadcast medium. It does take a level of knowledge and
some non-trival expenditure of money on electronics to access.

So? The real problem isn't some spammer but some lazy slob of a parent
that have no clue as to what their kiddies are up to and expect the whole
world to be thier baby sitters.

Nevermind that the ad itself was not obscene (not even by American
standards which are obscene themselves).

>door, would you post a sex advert somewhere you kew minors would have

Nah... most non-newbie wintel users are quite familiar with the inner workings of their machines. This, unfortunately, is quite the necessity and is even more severe under Win4 (JEDI refuses to refer to this latest upgrade as if it were something more than incremental).

>
>Hmmm... well, is this newsgroup only for people who've been on it for years?

A MONTH would be all that would be required to discover a thread with
something substantial in it.

You are trying to make comments on things you admit to knowing nothing
of.

>From its name I suspected that it might be the right place to discuss pros
>and cons of Atari computers vs. others, am I wrong? So when I find this

What do you think the flamewar degenerated from. If you payed
attention to the flamewar itself you might have picked that up.

>group full of threads whose names are insults to one specific person, I

So, you complain about having valuable time saved by WELL MARKED
threads?

>wonder how come? I haven't got the chance to read the starts of this from
>years ago, and I'm in no particular mood hunting through hundreds of

Don't kid yourself. These threads didn't start years ago. This isn't
Ent. vs. SD from r.a.s.s. (now rassm).

>postings quoting each other and adding yet another childish insult, either.
>
>: >that I don't care either... what I want to say is this:

>: of Petey's posts.
>
>I stated that I didn't pay "attention" to your flamewar, yes. I did *not*
>state that I didn't care. If I didn't, I would not comment on the topic.

You stated explicitly that you didn't care about the validity of Petey's
ideas.

>I would unsubscribe the group. I wanted to express the following:
>Even *if* his postings are shit, and whether they are or not doesn't matter
>for this argument, the way you react to them is *not* better at all.

That's rather superficial. It seems that you cannot be bothered to go
below the very outer surface of an issue...

>
>: If you payed better attention you might no be so 'perplexed'.
>
>Am I perplexed? Hmmm... I'd say no. I'm just wondering whether what goes
>on here is the right way to behave in a newsgroup, even *if* it's *.advocacy.

Well, if you'd been reading this group for an ENTIRE MONTH, you'd know.
Browsing the subject headers don't count.

>I looked into other *.advocacy groups, namely ms-windows.advocacy, and there
>I could find things like "Macs suck" and "Win95 has thrown back IT for years".
>Not exactly highly intelligent stuff either, but *lightyears* away from a
>flamewar like here. So I posted my thoughts about it, in what I regard as

...not reading the POSTS in that group either I see...

>a polite manner. No need to attack me, I should think?

You are engaging in the same behaivor that got Petey-boy flamed to
oblivion...

>Again, I could not "pay attention" because I am a newcomer. But is that a

No, you just couldn't be bothered to actually look into the issue
before making comments from the peanut gallery. Who knows. Petey-boy could be
suffering a serious injustice but, you'd never know.

>reason to treat me unworthy to express my feelings about the ongoing in this
>group?

Then actually attempt to inform yourself. It is not an active group. A
months worth of posts in here should be worth a day or two in c.o.m.w.a...

>
>: You also may have noticed that the 'Slam-subjects' directed at
> Petey
>: originated as demands for support and examples for threads he originated.
>
>Hmmm... do you mean that you (whoever) created a thread for each argument
>or opinion of Peter's that you considered wrong? Insulting him as

See... you can't even be bothered to pay attention to a post you are
responding to. Although, considering that the only headers that you've payed
attention to lately are the pure flames, it's not to unpredicted that you
actually missed the ones like: Peter can't be bothered to support his own
argument.

After some chiding he finally came up with some Mac DTP app I've never
heard of.

>stupid, in a new thread for each time he maybe was? Cause that's how it
>looks like to me.

Try paying attention. It helps.

"Mr. Maddog" <mrmaddog@prolog.net> wrote:

> You know, everyone is speaking about the "right" to post anything
> up on the Internet.
First, keep in mind that Usenet news is *not* restricted
to the Internet.

> But with that right comes resposniblity.

For example, whoever you are, whichever of this long list
of newsgroups you come from, *why* post it to comp.sys.cbm? *None*
of this has anything to do with 8-bit Commodore computers. I bet
most of the 8000 nude celebrity pics are in jepg format, which
cannot yet be displayed on a Commodore 64 or Commodore 128. I know
this didn't come from comp.sys.cbm. So I could trim comp.sys.cbm
out and still get to whoever sent this to us 'in public', as they
say, 'no private e-mail'. But what about the *responsibility* to
avoid mindlessly posting this thread to umpteen different newsgroups
because you are either too lazy or too unskilled to trim down the
newsgroup distribution list?
Hint #1: if you don't know how to trim the distribution list,
simply do not respond to a posting that was distributed to more
than 3 newsgroups. It's that simple. If you are spreading this
all over the place for no better reason than lack of knowledge or,
worse, pure laziness, *hold* *your* *tongue*. There's someone
else out there who has the same opinion (or close enough) who
is prepared to take the time to avoid this kind of spam
multiplication.
Hint #2: if you don't *know* what a newsgroup is about,
don't post to it. And it is no excuse to say, 'it was crossposted
on my newsgroup, I just hit "reply".' See hint #1.

Virtually,

Bruce R. McFarling, Newcastle, NSW

Eric Noss (mrmaddog@prolog.net) offered:

> You must remeber that not everyone wants to see this stuff.

AND I must also remember that not everyone is required to read a posting with the nauseous word "nude" in the subject line. Goodness me!

Next Tony Greenwood (stosser@airtime.co.uk) cautioned:

> ...postings should take into consideration that minors have just as
> much access to these newsgroups as your consenting adults do. I have
> this personal freedom you speak of, but I dont think it stretches to
> immoral perverted indecency....

Few things will pique an adolescents interest more than for an adult to tell them that something they see as pleasant, i.e., nudity, is "immoral perverted indecency". God, what a weird attitude. You did notice that interested parties had to SEND for this material, didn't you? It isn't distributed on the net and it probably will be MAILED to the recipient. Please note that there was no mention of donkeys, leather, children, etc.

Then Dave Baseley (dbaseley@cartech.com) ordered:

> ....[Blah blah blah (at least three bags full)]....Terminate this
> thread!...this discussion really does not belong here.

It's one of the fundamentals of discuss/debate, Dave, that you don't put forward your views and then imply that there is nothing more anyone else can possibly add by declaring the subject closed!

AND I'M GETTING QUITE TIRED OF YOUR CONTINUAL CROSSPOSTING, TOO, DAVE!

5006. Why so much Mac-phobia in Atari-land

Newsgroup: comp.sys.atari.advocacy
Date: 1996-06-22 00:00:00 UTC
From: Kronos@wco.com
Message-ID: <Kronos-2206960113220001@clavius39.wco.com>
Source record: 9013

As an ex-Atari user who has migrated to the Macintosh platform, I fail to understand why so many Atarians in this newsgroup seem hostile to the Macintosh. Perhaps it is the perhaps obsessive Apple evangelism by this Sinclair person, but I've noticed the same pc attitudes in other Atarians. There seems to be a marked bias by Atarians toward pc's rather than Macintosh. Forgetting for the moment arguments about megahertz, transistors, or prices, I would think the similarities in the icon-based computing environments of Macs and Ataris would make it a natural switch from one platform to the other.

On behalf of all Macintosh-dom, I apologize for Sinclair's rabid defense of the Macintosh in this newsgroup. It would seem unnecessarily antagonistic to continually promote a platform or continue a hostile and aggravating thread in a newsgroup devoted to another subject.

As for why many Atarians seem to be so pc oriented, I think its about computer machismo. For many people (we're talking guys here mainly) the more bells and whistles, complex acronyms and technical incomprehensibles a machine has, the more powerful they feel. A machine like the Mac, designed to be easy, powerful and user friendly kind of kills the joy for them of being a master computer wizard. Must be pretty threatening to use a computer like the Mac that smiles at you on start-up. Bill Gates uber alles! One Microsoft planet, no more of this easy to use stuff for real computer men!!!

You assume to much if there will be a liquidation. The inventory was older
models such as the 6100, 7100, older Performas and the 7200/75.

How can you blame him for what Commodore execs did!? That is idiotic!
I suppose you blame hard working people like Don Thomas and Bill Rehbock
for the demise of Atari, too.

>> I wasn't in marketing. But I *did* learn English.

>Yea, if you say so. But that English did not help you comprehend in the market
>needs, dumbass...

Who are you to talk about market needs?!! You, an Apple supporter, a
supporter of a company who for years tried to shove over-priced
underpowered pieces of CRAP on the consumer! You blast an ex-Commodore
employee for the fall of the Amiga when your own precious company is
in dire straits. Once again, you show us how much of a hippocrite
you are.

>No wonder your unemployed..Nobody wants to be associated with one who failed
>the Amiga, dumbass.

You are pathetic. What I can't see is how anyone would want to be
associated with YOU.

Kronos@wco.com (Todd Reed) writes:

>As an ex-Atari user who has migrated to the Macintosh platform, I fail to
>understand why so many Atarians in this newsgroup seem hostile to the
>Macintosh.

Actually, I think it's because we have an utter moron, Peter Sinturd,
on this group, spouting his Mac advocacy and trashing Atari. Other
readers have become hostile to his activity, and I think trashing the
Mac became part of trashing Peter.

> Perhaps it is the perhaps obsessive Apple evangelism by this
>Sinclair person, but I've noticed the same pc attitudes in other Atarians.
>There seems to be a marked bias by Atarians toward pc's rather than
>Macintosh. Forgetting for the moment arguments about megahertz,
>transistors, or prices, I would think the similarities in the icon-based
>computing environments of Macs and Ataris would make it a natural switch
>from one platform to the other.

Perhaps some see the same problems facing the Mac as did the ST, and
that's why they are not willing to jump on board a similar platform.
Yes, the ST and Mac are very much alike, maybe that's why Atarians
shy away from it since the ST's demise is so much a recent memory.

>On behalf of all Macintosh-dom, I apologize for Sinclair's rabid defense
>of the Macintosh in this newsgroup. It would seem unnecessarily
>antagonistic to continually promote a platform or continue a hostile and
>aggravating thread in a newsgroup devoted to another subject.

I don't think posters (flamers) on this group have anything against
other Mac users, it's just Peter. Don't take the insults personally,
because I think most people have separated a total user-loser like
Peter from other users such as yourself.

>them of being a master computer wizard. Must be pretty threatening to use
>a computer like the Mac that smiles at you on start-up. Bill Gates uber
>alles! One Microsoft planet, no more of this easy to use stuff for real
>computer men!!!

I have no like for Microsquash or Bill Gates. I would rather see them
go belly-up. There's too many things to hate in the PC industry nowadays.

Having said that, now I can say MACINTRASH SUCKS!!! Did you hear that,
Peter!? :-)

Todd Reed (Kronos@wco.com) wrote:
(please refer to his post in this thread)

It is nice to read a well thought-out post .. thank you!

We are all *mostly* computer interested and literate. A combination of a lack of people skills and an adversarial position do little to help keep the discussion on an even keel (note the use of profanity - also note that I am not a prude).

The PARC, Mac, Atari, Amiga (and even Windows - if they would just get rid of the "directory tree" and stick to the simple "see the file" list open folder and "don't see the file list" closed folder thingy) are all nice machines as far as GUI's are concerned. And, hindsight being 20/20, we can all be a little critical of 5 to 15 year old market strategies.

I think most people simply believe that there just wasn't enough competition in the market place. It would have helped if there had been an industry standard that all software and hardware could have been written to like the MIDI standard. But, oh well.

There really wasn't the revolution that was envisioned by the gurus of the 60's and 70's (the computer as the communication and information source of the "people" - whatever that means - grin). I need to find out more about Oracle - science fiction finally becomes science fact. Where is Benford, Bova and Card when you really need them.

Like the 520ST! Considering that Apple hasn't made LCIII's in 2-3 years, yea
its considered underpowered today. As for expansion, lot more than the hack
and slash 520ST..Plus the LC III was one model of the Mac family were choices
of more expandability was offered, dumbass.

> this is not altogether unusual [for apple].

I don't keep track of PowerComputing and Umax distribution system. I know that
Power is emulating Dell and Gateway of distribution through an 800 number.
Seems successful. If Mac clones are not available in storefronts in your area,
how is this Apple's fault.

>
> This also bears too much similarity to the state of Atari in these parts.

That is utter bullshit.. Power is only two years old and brings in more
revenue than Atari does.. Power sells direct mainly and also lets the catalog
mailorders like MacMall, MacZone, MacConnection and MacWarehouse to name a few
to sell the complete line of their Mac OS computers.

>>I am sure that there are other retailers that would carry the Supermac S900.
>>Why not give UMAX a call and ask for the nearest retailer..... As for me its
>>the catalog/mailorder way..
>
> Mailorder eh? Sounds like the mac advocate has no storefront support

What is this ferengi babble, jabba...What a dumbass. Desktop publishing is
being used more often in English/Journalism classes. When students have
experince with this sort of technology gives then an edge in college and the
workplace...

> Although general familiarity with DTP programs may be constructive,
> it does nothing to further the goals commonly associated with an english class.
> Also, for text authoring, it's overkill.
```

Who the fuck cares what you think? You don't know what their needs are.. So you
criticize a school for accepting a $100,000 gift from a prestigious college to
set up a lab for English and journalism classes that will be use also for
desktop publishing as well as a writing class. And most likely be used by the
school newspaper class.

>
> Great example petey-boy.

a ferengi specie, good job for contributing to the sorry ass nature of many of
the schools.. With people like you why bother improving the schools.?

: >Hi "Jedi",
: >
: >JEDI wrote:
: >: The content of your post would indicate otherwise.
: >
: >I beg your pardon? I honestly do not have a clue what you mean to say.

: You contradicted yourself. If you had actually been paying attention
: for the previous month you would have seen that the flamewar is only a recent
: degeneration of previous, older threads.

I said I'd been reading here "every now and then" for a month. Which means
I scanned the group from time to time, reading what interested me, and I
couldn't help noticing that most of the group's contents was Peter-bashing.

: You are trying to make comments on things you admit to knowing nothing
: of.

No. I'm commenting on your reaction to what I may now little of, namely
Peter's postings, but I need to know nothing about them to judge your
reaction as wrong.

: What do you think the flamewar degenerated from. If you payed
: attention to the flamewar itself you might have picked that up.

I think I stated before that I was in no mood to pay attention to a flamewar?

: >group full of threads whose names are insults to one specific person, I

: So, you complain about having valuable time saved by WELL MARKED
: threads?

No, I complain about having a group *full* of flame threads.

: Don't kid yourself. These threads didn't start years ago. This isn't
: Ent. vs. SD from r.a.s.s. (now rassm).

They certainly started before I started reading this group, and I was told that
this had been going on for years. It may be that the current threads are
not so old, but your opinions of Mr Sinclair-Day certainly are?

: >I stated that I didn't pay "attention" to your flamewar, yes. I did *not*
: >state that I didn't care. If I didn't, I would not comment on the topic.

: You stated explicitly that you didn't care about the validity of Petey's
: ideas.

Yes, I did. But I didn't state that I didn't care about the ongoings
in this group, which is what I thought you meant to suggest.

: >I would unsubscribe the group. I wanted to express the following:
: >Even *if* his postings are shit, and whether they are or not doesn't matter
: >for this argument, the way you react to them is *not* better at all.

: That's rather superficial. It seems that you cannot be bothered to go
: below the very outer surface of an issue...

Why is it superficial to suggest that if someone disobeys Netiquette, it is
not the right way to disobey it yourself in answering?

: >Am I perplexed? Hmmm... I'd say no. I'm just wondering whether what goes
: >on here is the right way to behave in a newsgroup, even *if* it's *.advocacy.

: Well, if you'd been reading this group for an ENTIRE MONTH, you'd know.
: Browsing the subject headers don't count.

I did more than browsing the headers. There were some threads that did contain
other things than flamewars. These made me feel that the flamewars might be
unappropriate, or at least a little disproportional in their extent. Which
I then stated when the chance had come to do so.

: >I looked into other *.advocacy groups, namely ms-windows.advocacy, and there
: >I could find things like "Macs suck" and "Win95 has thrown back IT for years".
: >Not exactly highly intelligent stuff either, but *lightyears* away from a
: >flamewar like here. So I posted my thoughts about it, in what I regard as

: ...not reading the POSTS in that group either I see...

Yes, I did! Only that it doesn't matter for the argument here whether I did.
They contained what I'd expect: discussion, and the occasional moron insulting
people for their opinions. Just fine. ;-))

: >a polite manner. No need to attack me, I should think?

: You are engaging in the same behaivor that got Petey-boy flamed to
: oblivion...

Huh? Being polite got him flamed? *Now* I'm beginning to understand... ;-)

: >Again, I could not "pay attention" because I am a newcomer. But is that a

: No, you just couldn't be bothered to actually look into the issue
: before making comments from the peanut gallery. Who knows. Petey-boy could be
: suffering a serious injustice but, you'd never know.

Again: I *do* *not* *care* whether or not Peter suffers an injustice from
your repeated, and increasingly substanceless, stating that he is an idiot.
He may be one, and then again he may not be --- I do not know, nor do I care.
I *do* *care* about your abuse of this group in stating that he is an idiot.
A newsgroup is not the place to do so. Got it???

: >reason to treat me unworthy to express my feelings about the ongoing in this
: >group?

: Then actually attempt to inform yourself. It is not an active group. A
: months worth of posts in here should be worth a day or two in c.o.m.w.a...

I did inform myself about what is and what is not appropriate in newsgroups postings. I am not informed about who is right or wrong in your battle, but I am informed about the battle being wrong here.

: >
: >: You also may have noticed that the 'Slam-subjects' directed at
: > Petey
: >: originated as demands for support and examples for threads he originated.
: >
: >Hmmm... do you mean that you (whoever) created a thread for each argument
: >or opinion of Peter's that you considered wrong? Insulting him as

: See... you can't even be bothered to pay attention to a post you are
: responding to. Although, considering that the only headers that you've payed
: attention to lately are the pure flames, it's not to unpredicted that you
: actually missed the ones like: Peter can't be bothered to support his own
: argument.

OK, so maybe he can't be... but why did you (whoever) feel the need to create a new thread for the discussion (or so it seems) of whether one person can't be bothered to support his own arguments? A followup posting in whatever thread it occured stating, "Hey, why can't you be bothered..." should suffice? It's things like that which disturb me here.

: After some chiding he finally came up with some Mac DTP app I've never
: heard of.

Which goes to prove what?

: Try paying attention. It helps.

I am in no mood to pay attention to what doesn't interest me. I am in no mood to have to pay attention to what I feel should not be posted in this group just to get your kind permission to state that in my humble opinion, *and* by the way according to Netiquette, it should not be posted here.

: >: When rational discourse fails, there is no point in maintaining
: >: civility. It is wasted effort.
: >
: >When non-civility fails either, I believe there is no point in maintaining
: >communication. I believe this is wasted effort then as well.

: Some of us enjoy the occasional bout of 'pig wrestling'...

OK, do it. But looking at this group (and *no*, not only at the headers) I don't get you with the "occasional", I'm sorry to say.

: >
: >: Also, burden of support falls on the one who asserts. (namely

: > Petey)
: >
: >Huh? I don't get you.

: I don't suppose you would. You have appeared to be pretty clueless as to
: the content of the posts on this group thusfar.

I meant that I had a language problem, sorry. So you meant "it is for Peter to support his arguments, because he stated them"? OK, fair enough. But again: why does there need to be a thread stating he doesn't? If he doesn't, how about a followup stating: This argument went unsupported, so it doesn't count?

: >OK, then could you not agree on leaving the flamewar in one thread, or in as
: >many as the flamed one creates? I get the feeling that Peter only replies to
: >whatever insult you come up with against him. And maybe, once in a while,
: >replies to a post that does not insult him. So the way might be not to insult

: Of course. It is much less mentally taxing to reply to a post with no
: substantial content.

Which goes to prove that ignoring him might reduce "flame traffic", thus increasing appropriate traffic if not in absolute numbers, then at least in percentage. Which is what we should aim for. IMHO.

: >him whenever the opportunity arises, but to discuss matters rationally not
: >with him, but with the other readers of this group, and to keep the flamewar

: Your attention is lapsing again...

Where? What's the problem in discussing rationally the pros and cons of Atari computers with persons other than Peter?

: >in one thread. Or maybe to add a "FLAME:" to the subjects of the flame
: >threads.

: You mean to tell me that having an insult in the subject line is not a
: clue enough that thread is a flamwar. Are you pretending or are you really
: that dense?

OK, that's one point for you here. Sorry. But why do you insult me? :-(

: >I just cannot believe that grown-up persons like you, me, and Peter, can't get
: >along without rendering a whole newsgroup practically useless. There are

: If you want it to become un-useless then do so. No one is stopping you.

I'm trying, thank you. ;-)

: >other ways of dealing with ones who are a pain in the ass. Ignoring, for
: >exapmle. Or, if that fails, complaining to postmaster@his.site. Or, if

: a) MOST of his behavior doesn't warrant that
: b) it's already been tried.

But it does warrant a flamewar, against Netiquette? Odd.

: >that should fail, mailbombing. Or, if that should fail too, killfiling

: Ohyeah... critizise us for indulging in flames and then advocate
: mailbombing. This is not a bright thing to do in the same post that advocates
: tattling to postmasters.

Just my ideas.

: > But I don't want to killfile *everyone* here that contributes
: >to Peter-bashing, because I think someone might add useful thoughts to some

: Then buy a newsreader that can kill based on subject or header...

No help there, I'm using the one at school here. And even if I did,
I'd have to add a new subject to it each time you go and start a new thread
of the "Petey is a chicken" type. Which is exactly what I'm complaining about
here.

: >other discussion here. And, even if you can't believe it, I think Peter
: >might do so too, when given a chance and not brought to rage by insults
: >like yours.

: Well, I do admit that my chides are a bit more effective than the recent
: tendency to fall into the 'dumbass' rut around here...

OK, then please try and keep it that way... :-)

: >
: >I'm no particular fan of Peter, and some of his comments did strike me as
: >stupid, too... I just don't feel that your reaction to them is appropriate.

: To bastardize a quote: I have not yet begun to flame!

Then would you please stay as polite as you are, and not start to flame?
Thank you.

: >What I feel appropriate I stated in my original posting, and above.
: >When you have tried all of this, and it didn't work, then why do you
: >overreact like this? Why do you make people feel that "we need a new

: Pet Peeve: Clueless Pundits.

I beg your pardon?

: >newsgroup", istead of trying not to waste the old one anymore like you
: >apparently did for the last couple of years?

: ...more arrogant presumption...

Have you begun to flame yet? It certainly feels that way.

Yours,
Erik Meltzer

Well, gee, Bob, since I don't feel like searching all of the more-than-a-dozen groups _you_ posted _this_ in to
try to figure out where you were when you wrote it, I guess you'll have to live with cross-posted replies, won't
you?

How does that rule go? It's a Navy thing... Ah, I recall now: "Do as I say, not as I do!"

>What is this ferengi babble, jabba...What a dumbass. Desktop publishing is
>being used more often in English/Journalism classes. When students have

Desktop Publishing is overkill for a composition class.
Journalism was not addressed in your original example. There, page
layout and typesetting are remotely relevant to the goals of the course.
```

>experince with this sort of technology gives then an edge in college and the
>workplace...

...sounds more like Microshaft marketing indoctrination. There is no added
utility in using a DTP package to draft a composition. It may be useful for
to fluff up the final copy but that is all.

This is where bloat begins.

People are encouraged to use an M-60 when a pellet gun is really the tool
for the task.

This is additional vocational training. It may add utility in general but, it still
adds nothing to the usually stated goals of a composition course.

...and DTP for composition is still overkill.

>
>> Although general familiarity with DTP programs may be constructive,
>> it does nothing to further the goals commonly associated with an english class.
>> Also, for text authoring, it's overkill.
>
>Who the fuck cares what you think? You don't know what their needs are.. So you

You never addressed my point. How is DTP not horrendous overkill for
simple text authoring?

>criticize a school for accepting a $100,000 gift from a prestigious college to
>set up a lab for English and journalism classes that will be use also for

You are indulging your imagination here...

>desktop publishing as well as a writing class. And most likely be used by the
>school newspaper class.

Schools having money to burn is not considered a common condition.
Also, DTP is still overkill for simple text authoring.
Also, composition is quite technology independent.

>
>>
>> Great example petey-boy.

As I said before. Nearly ANY platform is quite capable of handling the
task of text authoring. The Apple IIe is quite capable.
The grant should be spent elsewhere.

I have one of each of these within my own city. NONE of them have mac clones.
Furthermore, the mac selection they do have is sparse. These are very poor
examples. The only one worse would be CompUSA.

>

>how is this Apple's fault.

It's their licenced product. It's also apparently something necessary for their
long term survival. If they are not seeing to it (regardless of whether or not it would
normally be their responsiblity) then they are neglecting their best interests and
those of the users.
They are doing an Atari (or an Apple depending on your point of view).

Regardless of who's fault it is, an area of the country with ~50 Million people
is not being properly marketed to wrt Mac Clones.

>
>

sinclap2954@cobra.uni.edu (PETER SINCLAIR-DAY) writes:

>Are you a brain dead Ferengi? Does BestBuy, Sears and Wal-Mart ring a buzz to
>you.....)

Can't argue with logic, can you? None of the choices you gave above
is a good place to buy Apple products. Not one of those places in my
area carry Mac clones! Sears and Wal Mart have maybe 1 or 2 Apple
models. Best Buy might have 3 on display. And I'm in the Detroit
metro area.

You need to come up with much better examples than that. You sound like
an Atari Computer advocate of 1990.

>I don't keep track of PowerComputing and Umax distribution system. I know that
>Power is emulating Dell and Gateway of distribution through an 800 number.
>Seems successful. If Mac clones are not available in storefronts in your area,
>how is this Apple's fault.

Apple should be marketing their own products, right? Your logic is
"Tramiel-esque". Someone else isn't going to market your product.

>> This also bears too much similarity to the state of Atari in these parts.

>That is utter bullshit.. Power is only two years old and brings in more
>revenue than Atari does.. Power sells direct mainly and also lets the catalog
>mailorders like MacMall, MacZone, MacConnection and MacWarehouse to name a few
>to sell the complete line of their Mac OS computers.

What!? You just proved the point you were saying was bullshit! You
are relying on mail-order chains again! Once again, you sound like
an Atari computer advocate of 1990.

>> Mailorder eh? Sounds like the mac advocate has no storefront support
>> for the machines he advocates.

>Nope..For me it's convenience and saving sales tax.

That's pointless. In this whole argument you have taken the same stance
Atari advocates took 6 years ago. And what happened to Atari
computers? Let's track the path to oblivion:

1) Diminished retail presence, 2) mail order becomes main alternative,
3) foolhardy marketing approach is defended by advocates, 4) userbase
declines, 5) platform collapses only to be supported by enthusiasts
and some 3rd parties.

Atari's path sure looks like Apple's right now. And your arguments are only illustrating it even more. Open your eyes and realize what is going on here.

/Kevin

Message-ID: <steveg-2506962317180001@news.cnct.com>
Source record: 9049

I used to frequent this newsgroup quite often. About two years ago I got fed up with people confusing "advocacy" with "fanatacism", so I left. I just now resubscribed. Doesn't look like things have changed much, unfortunately. While I do admit to seeing a certain amount of maturity that has developed in most of the "regular" posters to this newsgroup, I'm utterly astounded that after almost two years Peter Sinclair _still_ continues his pointless arguing, while at the same time the many self-proclaimed "intelligent, mature" folks continue to taunt and fight with him. I still don't understand why, and I think I'll return this newsgroup to the "unsubscribe" list. Good day. :-)

Yeah, where's Ted Kazynski (I know that's mis-spelt) when you really need him?

However, I do have a similar solution:

mv (From: *sinclap*@*uni.edu*) > (To: root@uni.edu)

I still see his drivel, but now his sysadmin gets to see all of it, too. Automatically, even if I miss a post.

Hey all you guys, don't waste bandwidth (and forgive me for wasting it too).
Do you honestly believe that the original "8000 pics" article poster gives
a rat's ass about netiquette? If we give it more exposure, that's just what
the poster wants.

I say we just ignore it and go on with our respective newgroup discussions.
If he insists, we can all personally and *privately* volume-spam-mail his
account. A breach of netiquette is ignorable, an insistent b1FfHeaD should
be stopped with his own methods.

Come on now! That just is not the spirit!! Fanaticism and advocacy are
one and the same. We would hardly need an advocacy group for a bunch of
people who didn't really have an interest in their Atari now would we? It
is the fanatics who keep these groups going.

> As an ex-Atari user who has migrated to the Macintosh platform, I fail to
> understand why so many Atarians in this newsgroup seem hostile to the
> Macintosh.

One other point I failed to make in my earlier post. I wonder if there isn't something in the corporate stance of Apple that doesn't raise the hackles of users of other computer platforms. Something about Apple's 'inherent superiority' or something like that. Apple's PR and advertising all point to Macintosh as easy to use, plug and play, no sweat, fun computing.
Maybe it goes a little too far. I've heard people refer to Macs as 'toys' and worse. Perhaps the Apple propaganda machine goes a little too far in this respect. After all mastering a Mac isn't all that difficult compared to the problems of using a Windows machine.
I'm probably not making particularly incisive points here, though, the theme seems to be that the media has really taken aim at the 'dying' Apple, perhaps because Apple sets itself apart from the other computer makers in its corporate ideology and public stance. Does this post have anything to do with Atari advocacy? Unfortunately not.

sinclap2954@uni.edu sent me the following flaming email. Since I had already informed him that any further communications from him would be considered public, here's what he wrote, along with my response. I apologize to those of you who would rather not see his crap, and suggest that you move on to the next message now:

S> I understand that your mother screwed around with another significant
S> other instead of her husband to have you...Maybe thats why she is in
S> hell...now...)

I believe I've already mentioned that she's dead, else you wouldn't have made the last remark. Did I also mention that, if you were within physical reach, I would now be forced to remove your heart through your anus by pushing it out with a railroad tie?

You're very tiresome, old fool. Why don't you just go back to mopping the library's bathroom and leave conversation via computer to your betters? You know who I mean: The experimental rats in the biology lab.

Copies posted to sundry advocacy (and other) groups for the illumination of those who thought we were too rough on Petey Boy.

He already stated in our first exchange that you were basically untouchable; that he felt your posts were not abusive, in spite of the obvious
infammatory nature of every comment you make in newsgroups where you have no interest EXCEPT to incite flame wars. Thus, I feel no
compunctions about stating the obvious. If he is offended - well, gee, his attitude about your activities is offensive to me and to every
sysadmin who takes any pride in his system and the general class of the system's public image.

Drivel? When you were a kid, did you constantly cry to your ma ma and da da
when 'drivel' came your way? You're to easily get all defensive about nothing.

Who needs 32 bit consoles, thats why I love the Jag!

Yes Nt is not unix, there are actually good commercial programmes used
by real people who just want to get the job done without all the
techie bullshit thats why NT is growing and may eventually overcome
the scability probs currently limiting its usage in large sites, Unix
will never die (and it shoudn't either) but NT will just keep
increasing its share of the market..

Get off your high-horse. There are still 30 year old OS'es that
trample your beloved MacOS.

Progress is only a necessity if you are dissatisfied with your current
system. Considering your lust for progress, your mac must be very
unsatisfying...

& btw, the jag is the progress that you adore so much.
Why settle for a measley 32bits?

5072. Wanted: Atari Computers

Newsgroup: comp.sys.atari.advocacy

Atari ST series Computers and Monitors.

Introduced in 1985, the Atari ST series was Atari s answer to Apple s Macintosh. They used Motorola 68000 chips and had a graphic desktop user interface. They couldn t compete with giants like Apple and IBM in the long run however, and eventually became defunct. Modern Atari computers based on their basic design are still on the market today.

Although its 8mhz clock speed and standard 512k might seem outdated by today s computing standards, the Atari ST had at least two very redeeming features. One: standard onboard MIDI ports which are still very fast compared to today s computers. Two: The first really good multi-player interactive game.

MIDImaze was developed in 1987 to take advantage of the ST s fast graphics and MIDI. One hooks up to 16 machines in a daisy-chain MIDI ring and fires them up. Then all the players run around a first-person-perspective maze and shoot each other in real time. It s a little like Doom Deathmatch with more players and less gore, and it remains popular today.

We run MIDImaze for no charge at Con of the North, our local games convention. We plan to take it on the road at some time in the future. To do so we will need more Atari STs.

Absolutely any Atari ST or the later TT or Falcon will work for the game, so we are interested in any and all of them. We would prefer models with RF modulators because they are easier to modify for use with composite color screens, but if your computer does not have one and you have an Atari monitor for it we ll probably want it anyway. Old style 520s with no disk drive and 512k are just fine!

We are willing to pay $30-50 per computer or monitor, and we are also willing to pay shipping. If you live in the Twin Cities Area, we will even come and pick things up. Bonus!!! If you live in the 5 state area (Minnesota, Iowa, Wisconsin, the Dakotas) and donate an ST or two to the cause, we will come to your local games convention and run MIDImaze there!

PLEASE MAIL ALL INQUIRES AND RESPONSES DIRECTLY TO: jabeecher@aol.com.

If you are reading this and have any suggestions where we might post this to better effect, please do not hesitate to tell us.

Thank You for your time!

In case anyone is interested, ther have been less than 10 messages in this base since 1 July 1996 that did not involve Peter Sinclair-Day in some way, shape, or form.

Since he's such a wonderful person (and since I will never see his messages again, since my auto-killer is now working), maybe I'll write an auto-spammer that randomly bounces all his spewing into the alt.sex heirarchy...

Naw, even perverts don't deserve that.

NT is cool , but who has 550$can for workstation version? I'll stick with linux for a while and cross my fingers that VERY smart programmers out there will make it as easy as Mac.(I do like linux as it is, not my girlfriend... She wants easy stuff so I have W95 for her:)Then Linux will kick Bill's butt. However for now It is more like for ISPs then home users.

Note that Joe was only pointing-out that Ms-WinNT is not UNIX. He wasn't making any claims about the "natural superiority" of UNIX over Ms-WinNT. That being said...

>Yes Nt is not unix, there are actually good commercial programmes used
>by real people who just want to get the job done without all the
>techie bullshit

Getting kind of defensive, are we not?

Anyway, are you trying to imply that for UNIX there are no "good commercial programs used by real people who just want to get the job done without all the techie bullshit"?

> thats why NT is growing and may eventually overcome
^^^^^^^^^^^^^^
^^^^^^^^^^^^^^
Now *that's* confidence, isn't it? :-)

>the scability probs currently limiting its usage in large sites, Unix
>will never die (and it shoudn't either) but NT will just keep
>increasing its share of the market..

I wonder... I wonder what makes folks think that Ms-WinNT is
somehow going to "out-UNIX UNIX" while at the same time remaining
the simple (?), pleasant (?), user-friendly (?), and easy-to-use
(?) animal that all Ms-* lovers have come to know and worship?

And I wonder how many of those touting Ms-WinNT over UNIX have
actually had any degree of experience with any of the modern
UNIXes. (Or *anything* other than Ms-*, for that matter.)

Regards,

5076. Proposal: alt.binaries.atari

Newsgroup: comp.sys.atari.advocacy
Date: 1996-07-11 00:00:00 UTC
From: Rich Tietjens <RichardX_Tietjens@ccm.jf.intel.com>
Message-ID: <31E550DA.261E@ccm.jf.intel.com>
Source record: 9083
Cross-posted to:
alt.config,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.st.programmer,comp.sys.atari.advocacy,comp.sys.atari.8bit

The proposed group would serve as a place to exchange small patches, release small shareware packages and updates to existing packages, post items that have been requested in one of the other comp.sys.atari.* newsgroups, and so forth. There has been some discussion of how to handle Atari binaries since the closing of
comp.sys.binaries.atari.moderated
and the general consensus in c.s.a.s has been that a dedicated newsgroup is needed; it is inappropriate to post large binaries (>16k) in any of the existing groups, and if this proposal is approved, it will then be possible for those users who do not wish to download binaries to simply not subscribe; at present, someone will post a binary from time to time and users who must pay for on-line time, and who do not want the binary, complain (quite reasonably so).

Comments welcome. Flames to dev/null, thanks.

I believe that a alt.binaries.atari or alt.binaries.atari.st is badly
needed since our moderated binary group has lost it's moderator and been
expunged!

That is the one in question, it doesn't seem possible to get anything
in there,
I would like to add my support for either a new binaries group for
the ATARI platform or making the existing one none moderated? if that
is an option?

Cheers.............!ynoT

I considered that, and would have preferred it, but when I submitted the
proposal to one of the group mentors, I was informed that, precisely because
the existing moderated group had been killed at the request of the moderator,
it would be extremely unlikely that a new groups would be approved. Alt. groups
are far easier to create (anyone who doubts that should start counting alt.
groups in his NG file <G>), which is the logic behind the current proposal.

The "existing" group was removed (rmgroup) in March or April. If your
ISP says otherwise, then they aren't keeping up with changes.

I thought posting the charter was a bit premature, but this one is almost perfect.
I suggest we adopt it as the "official" charter.

Again, comments welcome. Flames to root@uni.edu <EVIL GRIN>

I'm a little puzzled (not knowing *anything* about the organization of
the Atari groups, or indeed of the Atari itself): Rich's posting refers
to comp.sys.binaries.atari.moderated, yet that appears to have placed
binaries directly into a non-binary hierarchy. Was any such group ever
officially in existence (being Big-8, it would have had to pass a RFD/CFV
process)? I would have thought the most likely reason for the group to
have been, as Tom puts it, "expunged", is that David Lawrence has
conducted some Augean stable-cleaning. I can find *no* signs of any
comp.sys.binaries.* hierarchy, which is the way that I as a newsmaster
would like to see things remain!

According to my active list, there *is* a comp.binaries.atari.st, which
is indeed moderated. Was it perhaps this group that you and Rich meant?
If so, rather than creating a new group in the alt.* hierarchy (which
might take some time to achieve good propagation), why not simply appoint
another moderator, and start using the group again?

(I'd wanted to cc this response to Rich as well as Tom, but the latter
didn't retain the former's address in the attribution.)

You could try bypassing the moderation. Pretty simple to do. Left as
an exercise for the reader.

> I would like to add my support for either a new binaries group for
>the ATARI platform or making the existing one none moderated? if that
>is an option?

It is a Big-8 group, and if you can prove that the moderator is not
doing the job he signed up for, you can put forth a proposal to replace
him or to remove the moderation. (Note this will make it the second
comp.binaries.* newsgroup to not be moderated, alongside comp.binaries.-
apple2 which has never been moderated and still gets people posting
non-binaries to it.) Comp.society.folklore went through a vote to
remove moderation (it failed, but a new moderator did get appointed and
it now gets traffic). Take the cause to news.groups and put together a
complete proposal for submission to news.announce.newgroups.

I myself have no vested interest in the topic. I'm only suggesting a
course of action.

Followups directed to news.groups.

Source record: 8955

Some years ago I used to be the editor for "Inside Info", the disk magazine for ACE, the Atari Computer Enthusiasts user group in Sydney Australia. Just before the release of the Falcon in this country I wrote an article speculating on the future of this machine. While I don't profess to be totally factual It is interesting to read this now a few years later after I wrote it (in late 1992).
Note that prices are in Australian dollars at that time about .70 US$ and Australia was in a severe economic recession.

I was doing a cleanup on my PC (I also have a Mac) and came across heap of text files I saved when I sold my ST.

ATARI and the Falcon

By Phillip White (ACE Editor)

Previous issues of Inside Info have looked at some of the problems associated with Atari, ranging from gross mismanagement, to conspiracy theories. Even amongst dedicated supporters of Atari, there is a high level of cynicism regarding the ability of this company to promote its product.

The Big news in recent months has been the Falcon 030, the successor to the ST and saviour of Atari. After an initial flurry of news regarding the specifications and capabilities of this machine, it appears that it will be quite some time before they are going to be available.

A company such as Atari which is making a loss, has a low consumer profile and a diminished market share, is not in a good position to launch a new product in a saturated computer market. The perception of the company is that of an arcade machine manufacturer that also makes "home computers". In spite of the efforts of Atari enthusiasts this attitude still persists, and at times has been reinforced by Atari themselves.

The Atari ST when it was first introduced, was in a good position to be considered by the home computer user. It was much cheaper than the Apple Macintosh and used a similar graphics interface which gave it an edge over the unwieldy MS-DOS machines. The low price of the ST was possible through some ingenious cost cutting measures and allowed Atari to promote the ST as the "Power without the Price" computer.

Atari was to enjoy a period of success with the ST and many new computer users as well as existing Atari owners were attracted to the new model. The inclusion of MIDI ports on the ST meant that Atari had a sizeable representation in the music industry, a position it still holds today. Atari however, was slow to respond to trends in the computer industry and

customer expectations which placed ever increasing demands on the performance of personal computers.

Limitations in the flexibility of the ST's design meant that it was difficult to upgrade the operating system, as well as incorporate features such as extra memory and enhanced graphics capabilities. When the ST was released however, such features were seen as luxuries and what the ST had to offer in terms of performance and price was more than enough for the home user.

An attempt was made to rectify some of the design problems with the release of the STe series with an operating system upgrade, easier memory expansion and extended colour palette. The improvements however were largely inconsequential and the STe also came with several curious bugs, as well as Atari's strange policy of soldering in the RAM to disallow user memory expansion.

At the time of the STe release, Atari announced that a 68030 computer known as the TT would be available as a high end Atari platform. Along with the TT, Atari produced the Mega STe which essentially was a high performance STe but without the extra features of the TT. When these impressive machines were finally available in Australia, there were virtually no retailers left who stocked Atari products and very little software which took advantage of the features these computers had to offer.

Atari adopted a minimal promotion strategy for the ST and subsequent products, in the belief that retailers and existing users would attract new customers to the platform. The legacy of this strategy can be seen with the almost total lack of retail outlets for Atari computers and software in Australia. Also, countries like Germany, which showed promising sales figures, received special attention from Atari while their market in the rest of the world was neglected.

A major consequence of this has been the steady departure of 3rd party software and hardware developers from the Atari platform. Many developers who initially were attracted to the ST, anticipating that Atari would get behind their product and improve on it, have abandoned Atari altogether. There is little incentive in developing an application for a computer that is not selling very well and most developers have switched platforms so that they don't starve.

A side effect of this has been software piracy, by no means exclusive to Atari, which has discouraged developers even more. Sadly, many users resort to piracy because of the lack of software available locally. Few users are willing to risk purchasing applications from overseas without evaluation. Many dedicated users who ordered from overseas and demonstrated their purchases at user group meetings, have changed platforms, thus depriving many ST owners the opportunity of reviewing the latest software.

The Plague
~~~~~~~~~~

Even without the lack of promotion, Atari would still be having a hard time of it along with Commodore, Apple and IBM. The computer market has been saturated with MS DOS compatibles which are sold at extraordinarily low prices, partly because of the recession and partly because of the sheer volume of units. For under $1500, a 386SX PC can be purchased with 2 Meg of RAM, 85Meg hard disk, Super VGA monitor, mouse and windows. Even better deals are available if one is prepared to shop around.

The early success of the PC relied on its ability to be configured any way the user desired, ranging from that of real estate management to EPROM burning. The command line interface of the MS-DOS operating system although inherently powerful, is not easy to master and tends to discourage multi-application use. This meant that most PC's tended to be used in the workplace in dedicated roles and were generally not considered to be a good choice as a home computer.

Steady improvements have been made to the PC in the form of increased speed, memory expansion, graphics enhancement and an easier user interface in the form of Windows 3. Although the PC is still difficult to configure, these improvements, together with the current low cost, have made the PC attractive to home buyers as well as businesses. The vast number of applications available at reasonable cost has also helped sales of the PC. Many home users can now use the same software at home as they do at work, a situation generally not possible with the ST, due to the lack of compatible applications. For an ST owner who is lamenting the demise of quality software, the PC is a very attractive proposition.

Along with cheaper PC's, the other computer companies have reduced prices and introduced new models. The Apple Macintosh, while still expensive compared to any Atari or a base model PC, is more affordable than ever and worth considering for the features on offer. Soon to come from Apple are even cheaper models. Commodore, while almost in the same boat as Atari, will soon release the low cost Amiga 600 with internal hard drive and the 68040 Amiga 4000.

The impact of all this on Atari can not be underestimated. With virtually no advertising, retailers, software, and customer support in this country, there is little incentive for a prospective buyer to purchase an Atari computer considering what is on offer elsewhere. Many existing ST owners have become disillusioned with Atari as local support for the platform steadily diminishes. Long time supporters continue to abandon the ST and purchase PC's and Mac's.

And so it is that Atari, which is in a dismal position brought about by its own mismanagement and economic factors beyond its control, is seeking to restore its fortunes with the introduction of the Falcon 030. If their past performance is anything to go by then the demise of Atari will be assured. Atari is taking an enormous gamble with the Falcon and it is entirely possible that it may be too late to save this once great company. The fact remains that Atari do make very good computers, but the
~~~~~~~~~~

world is not going to buy them if they make it difficult to do so.

On A Wing and a Prayer
~~~~~~~~~~~~~~~~~~~~~~

The Falcon is by all accounts an impressive machine and has features which would significantly add to the cost if included on other computers. The digital signal processor, video and graphic modes, audio processing and networking capabilities would conceivably consist of several thousand dollars worth of plug in cards if they were to be implemented on a PC or Macintosh. Yet the Falcon in its most basic configuration will sell for approx AU$1000 (converting from announced US prices). Add a cheapie monitor and Hard Disk and the one Megabyte Falcon weighs in at around $2000.

Atari have indicated that this will be their "low end" computer, with the implication that other more powerful models are planned along the same lines as the Falcon. There are some interesting questions as to what the new Atari range will consist of as there will be an overlap of computers with varying features and prices. Atari can ill afford to spread its budget to include all models in its catalogue.

It is entirely possible that Atari would be in a less precarious position today if they had concentrated on improving the ST range, instead of diverting resources into projects such as the ATW, Hotz Box, STacey, ST Pad, and ST book. Atari wasted much time, energy and money with these products which in some cases never eventuated or were unmarketable. In attempting to cover all bases, Atari failed to appreciate that the ST was and is the computer of choice for many users simply because of its excellent performance, ease of use and price.

Atari have now returned to the power without the price concept with the Falcon. A departure from the past can be seen in the options available in terms of freedom of choice and acceptance of industry standards. No longer is the buyer forced to accept an Atari monitor or a hard disk with custom host adaptor. Any industry standard VGA monitor and SCSI hard disk can be connected if so desired. The operating system is now largely disk based, making TOS upgrades much easier than before. Memory expansion with the Falcon however, is a worry, instead of commonly available SIMMS, Atari have devised propriety memory modules. It is expected that 3rd party modules will be available as an alternative.

Atari intends to focus attention on the multimedia features of the Falcon. This rather nebulous term means different things to different people and can be as diverse as quicktime movies on the Mac', 24 bit colour Opalvision for the Amiga and a slideshow with sound on a PC. A loose definition of a multimedia system is one that can record and play, digitally processed image and sound for entertainment and educational purposes.

This is something that most computers, including the ST, are capable of in some form but is generally accepted that to be viable, multimedia must
~~~~~~~~~~~~~~~~~~~~~~

be able to record video and sound, process it and replay it at near broadcast quality. There are many variables associated with this ideal, but the Falcon would appear to be the only computer that has this function built in. Most other comparable multimedia systems are either expensive dedicated workstations or pricey plug in cards for the high end Macs, Amigas and PC's.

Atari is almost certainly going to face an uphill struggle in marketing the Falcon. Its multimedia capabilities will no doubt result in rave reviews of the machine, but there is limited demand for this capability at the present time. Most computers are purchased for the less esoteric tasks, of word processing, maintaining databases/spreadsheets and a bit of DTP. For these jobs, a cheap PC will do.

Speculation Corner
~~~~~~~~~~~~~~~~~~

In the tight economic climate, the Falcon may well be seen as too frivolous, rather like Commodores CDTV. There is however a push within the computer industry to accept Quicktime as the standard for multimedia presentations. It is anticipated that most computers will be able to replay Quicktime, but recording movies requires relatively expensive video processing hardware. If quicktime is adopted for the Falcon it could well find a niche as a creator of Quicktime presentations.

With Desktop Video, The Falcon is certainly light years ahead of anything Atari has had to offer before. Atari is also light years behind in this area, with the clear leader being the Commodore Amiga. Both the Amiga, Mac and PC's can be fitted with Video cards which offer Desktop Video at varying budgets. As impressive as the colour and video capabilities of the Falcon are, Atari has made a grave mistake by not providing slots for graphics cards. Paint, animation and modelling software has lagged behind with Atari and it is unlikely that established videomakers will switch over to the Falcon unless the applications exist. It is possible that as an interim measure, software will be ported over from other platforms to fill the gap.

Probably the most astounding feature of the Falcon, which will guarantee sales is the audio processing capabilities. The inclusion of 16 bit CD quality 8 track direct to disk recording is amazing. To have it in a computer for a thousand dollars is revolutionary. True, a big hard disk is required, and appropriate software, but for under $3000 a musician can have the recording quality and creative control of systems in the $10000 to $15000 range. Unlike MIDI which appealed to electronic musicians, hard disk recording is also of value to acoustic musicians thus opening up a large market for the Falcon.

There are many possible uses for the Falcon, based on the capabilities of the DSP chip. Some of these are useful, some are not. The notion of plugging one into a phone line as a fax machine will either be extremely handy or just plain silly. Wild speculation on what the Falcon is capable of, will do nothing but foster suspicion and until the Falcon is
~~~~~~~~~~~~~~~~~~

readily available, it is too early to say how it will perform and whether it will prove to be the amazing machine that Atari wants us to believe it is. Atari not only has to attract new customers, but has to bring back those enthusiasts who have left the fold.

Have you considered that there are many intelligent people whose lives
are not "all about computers", but they use them as tools? Why buy a
hammer, when you can forge your own? Forget about changing your oil, or
fixing that leak in the roof, or playing your guitar; there's a hammer
to be made.

The truly stupid person is the one who gets caught up in some philosophy
about how things should be done, instead of doing things the way that is
most useful for them, as an individual.

The truly intelligent person knows when it is best to use the mouse, and
when it is best to type a command, or write a script.

The fool has a philosophy that says there is only one best way for
everyone, or that everyone has the same amount of time to spend on one
facet of their activities.

5103. Atari Binaries - Inaugural Message

Newsgroup: comp.sys.atari.advocacy
Date: 1996-07-13 00:00:00 UTC
From: starship@3rdplanet.com
Message-ID: <552425755.432033.A.starship@3rdplanet.com>
Source record: 8961
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.st.tech,comp.sys.atari.programmer,alt.binaries.atari,alt.binaries.atari.d

This message inaugurates both alt.binaries.atari and
alt.binaries.atari.d

CHARTER:

alt.binaries.atari is for distribution of freeware, Public Domain, and shareware patches, programs, etcetera, intended for Atari and compatible computers. alt.binaries.atari.d is for discussion of the content of alt.binaries.atari and should never contain binary files.

The following are explicitly inappropriate for posting to either alt.binaries.atari or alt.binaries.atari.d:

- Copyrighted software without the EXPLICIT permission of the copyright holder to post the software.

- "Chain letters," "get rich quick" schemes, for sale messages, or commercial solicitations of any kind.

- "My computer is better than your computer" messages, or discussions of the relative merits of any computer system. These discussions properly belong in the various .advocacy groups (or alt.flames in some cases).

- Any posting whatsoever by Peter Sinclair-Day; he does not own an Atari or compatible computer, does not use an Atari or compatible computer, and does not hold the copyright to any known software.

Very large binaries (e.g., in excess of 500k) should be uploaded to an ftp site (or several) first, and the availability (with full path) announced in a.b.a; only in the case of a specific request by a user who has no ftp access should such large binaries be posted to the newsgroup.

It is suggested that a short text message be posted in a.b.a immediately before posting a binary, explaining the purpose of the binary, the copyright status and distribution policy pertaining to the binary, system requirements for use of the binary, and any special information which may assist in determining the desirability or undesirability of downloading the binary.

This is an unmoderated group. However, it will be closely watched by the undersigned, and any blatant violation of copyright law will be immediately reported to the violator's postmaster and the copyright

holder. Violations of netiquette will be referred to the appropriate
postmaster if it is deemed necessary.

Perhaps I am confused. Isn't this comp.sys.atari.advocacy? I use NT at work (along with Win95, WFWG, Novell, and I forget what all else), and there ins't a single Atari system there; nor are there any Atari-compatible binaries of NT (thank you, Lord Bel!).

As MicroSlop goes, NT is OK - but it's not Atari, so who gives a Peter Sinclair-Day?

: > channel.

The difference between c.b.a.s and a.b.a is that c.b.a.s was an ST only
newsgroup. ST only means that all other Atari submissions must be
rejected by the moderator. a.b.a is (will be) a generic Atari software
group --- if someone has a piece of Atari software from any pltform that
they'd like to post (that's not WaReZ), they can post it in a.b.a and be
within the confines[1] of the charter.

-Kyle R. Hofmann

[1] Confines? Ha! More like a one inch high wall made of styrofoam,
judging from some of the discussions I see (and participate in :)
everyday.[2]

[2] This does not mean that WaReZ will be OK in this group, just that
charters generally look silly in comparison to the actual postings that
occur on a group.

ECP is "Excessive cross posting", also known as spam. This is when you
dump as many newsgroups as your news server into the Newsgroup: line and
send out a message.

EMP is "Excessive multi posting", also known as spam. This is when you
find all the newsgroups you can and send out a separate copy of your post
to each one.

Both are Bad Things.

Hey,
Watch it. You have broken the first Law of Usenet Advocacy.
There is only one true OS. Everything else is useless.

As a penalty for making a reasonably sane and drivel-free
posting, I banish you for one week from this newsgroup.
Your next posting must be at least 50 % invective and
no less than 95% content free.

8-)

Seriously though, what's up with these OS Jihads? Why do so many
people get so bent out of shape on these advocacy forums?
Gawd, you'd think that there were no more pressing problems in the
world than OS Advocacy.

I do often find some really informative threads (even on .advocacy)
but so much more traffic is turning into flamefests.

> > moderator and the readership, it is now removed.

(1) I voted to retain the group.

(2) The "vast majority" did not agree to anything. Perhaps a dozen people
were even aware of the existence of the group, and I saw exactly one person
(other than Annius) stating in a comp.sys.atari.* group that they agreed
the group should be removed.

(3) It is my belief that Annius simply didn't want to expend the effort to
moderate the group any more. Note that this is my personal belief, with no
evidence to support it. However, read on...

(4) I submitted several binaries for distribution during the last month of
the group's existence. They never appeared in the group, nor was their receipt
by Annius ever acknowledged.

I believe that there are large numbers of Atari users who have no or very limited
ftp access, who would use an unmoderated binaries group. I know for a fact that

the largest ftp sites for Atari files are very slow to post new binaries to areas where they can be obtained (I have personally uploaded 2 binaries to several sites; both have been obsoleted already, and they aren't available to the public yet).

Yes, well, thanks but it doesn't seem to have worked. I'll ask here - does
anyone have direct root@domain access to send the necessary control messages
to try again to create these groups? I can email the necessary header(s) and
text if you aren't sure how it's done.

Really? I'm here on a T-1 line direct to the USenet backbone: I tried
to get a.b.c.a, with the following results:

News host responded: No such group

So, if your service shows that such a newsgroup exists, and it has
existed more than 6 months, I think perhaps either your sysadmin or mine
is mistaken. Mind you, I'd be happy to be wrong.

Umm... guys, I went through the trouble of creating
alt.binaries.comp.atari8bit a while back - why not use
it? I can think of only two reasons:

1) The 'binaries' part of the group name will automatically
ban it from some news servers.

2) The 'alt' part of the group may do the same.

The only thing that would really be better than the
existing group would be a new one in the 'comp.*' hierarchy (sp?).
If someone wants to try and push that through, I say 'go for it'!

The group has been rmgrouped; if you show it as active, then you missed the
removal message. I wish everyone had.

I might take issue with the second half of his sentence, but I agree
that arguing with him is pointless.

> Those straight lines were just too ripe to pass up...

Certainly.

My $02 worth: I use NT, Win95, various flavors of DOS, Novell,
WFWG, sometimes OS/2, and some other oddments at work. For installing
networks, the command line is MUCH easier to use and to troubleshoot.
For editing text, I want a windowed environment. It's a helluva lot easier
(for me) to drag a text block to the correct page than it is to run edlin
or even vi (I use a Unix look-alike at home sometimes).

For anything other than installations, in fact, I'd rather a windowed
environment. GEM is my GUI of choice. Why a GUI? Because I might not
want to kill the current process in order to copy a disk, or delete or
rename a file, etcetera, etcetera. I don't insist that a GUI is /the/
best OS choice for everyone - in many cases, it might be the worst. But

for me, it makes sense.

And I run my CLI in a window.

Yes. Commercial advertising of any kind is inappropriate outside of the
business groups (with some minor exceptions - the .announce group would
be the right place for "reduced price" announcements that specifically
pertain to that type of system, I think).

Progress for progress'es sake is meaningless. We have to need to surrogate
our genitalia with our computers here.

Progress is not necessarily beneficial and new does not necessarily imply
better.

Progress in microcomputers merely means implementing that which has
been standard on larger systems for decades.

VMS still trumps MacOS, despite being 20 years older...

>on the Jag and ST line. If this nation read your advise we all would be riding
>horses for our transportation.

Actually, this nation's transportation technology has been completely stagnant
for the last 50 years. Personal transport tech has been stagnant for nearly
100.

I don't really give a damn about your laptop. They are not progress to me
as they are not comfortable for me to use. The keyboards are too small.

>

Well, someone get a proposal together and send it in to
news.announce.newgroups, or track down the existing moderator and ask
him to resign his position and appoint a new moderator (or moderators)
that will do the job.

When your car gets a flat tire, you don't buy a new car. You get a new
tire, and a new spare tire too.

In this instance, Portal is correct; I'm sorry, I must have unconciously added
the ".st" in the middle of that.

> I for one have been right here on comp.sys.atari.8bit on and off for nearly

I can email you a complet newsgroups list, if you need it. It's rather bulky
at about 350k, but if Portal won't tell you waht exists, I will. IMHO, any
and all "warez" groups that exist are pirate groups, and I won't subscribe to
them, even if I can find them (there are several listed in my NG file).

Not only that, but an unmoderated group doesn't depend on the whims of one
person to give it content.

> This is probably a relatively valid reason for removing a group.

This would be a valid reason /IF it were true/, but it is not. Submissions
wer made - and ignored. I submitted several files in the omnths prior to the
group's demise, and I have seen others state the same thing; no response was
ever forthcoming from Annius. I don't know if that means he did not get the
files, or simply chose to ignore them.

> > The Atari ST is no longer a very active platform,

It's tantamount to saying that "the 286 is not a much used chip any more, so we will no longer write software that does NOT use 386 opcodes." Granted, there is a lot of software that won't work without those opcodes - but probably 90% of the current DOS-based software, including most network drivers for Novell networks, work just fine on 286 boxes. I doubt that the owners of those networks using 286 servers and clients would be very favorably impressed by anyone who told them that they would be required to give up their existing hardware platforms.

It's also the way things are done, and frankly, it blows. Getting an alt. group for Atari binaries effectively removes the controls exercised by the "Big 8" cabal (and such a cabal obviously exists, else it would not be necessary to put a new group proposal to a "vote").

> > Annius V. Groenink <avg@cwi.nl> posted messages to the group asking

The fact that the question was posted in comp.sys.atari.st is true. The allegation that "the vast majority agreed" to rmgroup it is either a mistake,

or an outright lie. Since I don't know if the person making the statement
knows the truth or not, I will assume it's a mistake.

There is no longer such a group, Greg. It was removed some months ago
(March? April? May?) at the request of the moderator, and over the
objections of the users (the few of us who knew that the group existed).

We're not replacing a flat tire, we're replacing a stolen car.

I've tried two of my three accounts on different services now, and both
report that a.b.c.a does not exist. While you may have created it
locally, it isn't available on the Sprintlink backbone.

Hmmm... I *do* see it from two totally different accounts
(one on Primenet, the other PSI). My only guess here is that
some servers don't automatically start carrying new groups created
in the alt.* hierarchy.

The group *was* created by going through all the "official"
channels and such, so it really should be out there.

Any new alt.* group created for Ataris may have the same
distribution problems as a.b.c.a8, so, if nothing else I suggest
we at least find out why this one hasn't propagated all the
way through yet.

Oscar

Guy, I am including the balance of the comp.sys.atari.* groups in this discussion along with alt.config; it may be appropriate at this time to include news.groups as well, but I will wait for comments before doing so.

Guy Harrison wrote:
>
(I include here quotes from a couple of previous posters in the same thread - to save time, I'll reply directly to these as well.)
> >> Since the comp.* group died for lack of use, I expect the alt.*

> >> this group are primarily interested in a place to illegally
> >> repost copyrighted software.

This comment (whose poster may remane nameless unless he wishes to step forward at this time) is frankly slanderous. As the proposer of the new groups, /and/ an established software author, I take personal umbrage at the expressed implication that I am a pirate. I suggest you ask the former BBS sysop and the author of RatSoft BBS how I feel about pirates - of course, he may not be aware of just who blew the whistle on his pirate activities.

> >> Annius V. Groenink <avg@cwi.nl> posted messages to the group asking
> >> whether anyone still found it useful and the vast majority agreed
> >> that the sensible thing was to remove the group. At the request of
> >> the moderator and the readership, it is now removed.

This is patently untrue. Annius posted one or two messages in comp.sys.atari.st remarking that he was planning to have the group rmgrouped, but the "vast majority" most of the readers most certainly did NOT agree to remove the group. I think most of us simply found it impossible to get anything past the moderator. Personally, I voted to retain the group.

An now, back to Guy's remarks:

> I attempted to post to this group on more than one occasion - at

>
> Guy Harrison
>
> guy@swampdog.demon.co.uk

It certainly appeared to me that the rmgroup was "railroaded" though.
No voting results were cross-posted to the comp.sys.atari.* groups. By
that time, however, the rmgroup was a /fait accompli/, as they say, so
there was little anyone could do about it.

---
My apologies if this appears twice. My news reader barfed on my first
attempt to post.

One of the problems with setting up an alt.binaries group is that,
as has been pointed out earlier, many sites don't get parts of (or in
a worst case scenario) the entire alt hierarchy. The university here
just lopped off the entire alt.binaries tree several months ago because
the spool time on the server was less than six hours and the system was
thrashing itself to death.

I would propose that we try to make any group we want to see created an
"official" group in the comp.binaries hierarchy. For those of you
uninformed on what that means, here is a brief summary:

1) An RFD (Request for Discussion) goes out where the merits of creating
the newsgroup are discussed.

2) A CFV (Call For Votes) goes out where the proposed newsgroup is voted on.
In order for a group to pass, the number of YES votes must be 2/3 of the
total number cast, plus the number of YES votes must be at least 100 more
than the number of NO votes cast.

In theory, I support the creation of a binaries group - but I would rather
not see it in the alt tree. Alas, I'm not sure we would have enough people
voting in favour of the proposal to meet the second criteria for passage.

Any thoughts?

(Oscar Fowler mentions the already existing alt.binaries.comp.
atari8bit he started.)
I've been wondering about this. Rich Mier said correctly that
all that's in a.b.c.a. is some spam. And Rich Tietjens believes
he should be able to see it. I don't think many people can see it.
I also don't think many people can see the new a.b.a and a.b.a.d.
Somebody said these groups have to be added to the usenet groups
specifically by sysadmins, or systems are set up not to have
alt or binaries groups added. I can see the new Tietjens
groups and the old a.b.c.a. Something that has not come up
in this thread is the A8 vs ST thingy. STers generally don't
like to mess with A8 stuff, I think. STers sorta kicked the
8-bitters out of Delphi (rumor). Anyways, personally, I like
/prefer the alt.binaries.comp.atari8bit idea and keep it
separate from what I would like to see... ->
alt.binaries.comp.atariST. BUT, I do appreciate the efforts
of both Mr. Tietjens and Mr. Fowler and whatever you guys
wanna do is fine with me.

Thanks for your comments, James. I don't know anything about Delphi's history, but my feeling is that, if it says Atari on the logo, the user is (or should be) my friend. We have enough enemies, we don't need to make more within our own ranks. Thus, if someone objects to the placing of 8-bit software in a.b.a, I suggest they form their own binaries group (they could call it alt.binaries.atari.68k-bigots I guess).

What's really strange is that, although I am told others can see the two new groups I created (or tried to), and apparently can see a.b.c.a.8, my server (at my personal account) shows none of the three - but it does show a number of "warez" groups, even though the sysadmin has issued generic warnings that trading of warez will not be tolerated. I really don't understand the mentality that says "we'll make this available, but if you use it, we'll punish you." I don't /want/ to use it, but it seems to me that if the use is to be monitored, it would be much less work to simply rmgroup anything with "warez" in the groupname.

I'm very sorry if this is not the appropriate newsgroup for this...

ATTENTION! LOTS O' FREE 8-BIT STUFF!

I'm leaving the country in a matter of days, and would like

to ship all of this stuff to the first serious 8-bit enthusiast

who gets back to me... the sh Televsion (use as monitor!)(works fine as
a TV

except it needs new volume control)

Power supplies for all of above, etc.

SOFTWARE:

TONS of disks with lots of stuff; mostly games (fun

ones!) however, but there's ICD's SpartaDOS and

Atari's DOS v2.0, v2.5 and v3.0, a C compiler (!),

AtariWriter Plus (word processor with spell check),

Text Wizard (another word processor), Broderbund's The

PRINT SHOP, Atari Assembler Editor, Atari Macro

Assembler and Program-Text Editor, PASCAL compiler

BOOKS:

The Atari BASIC Source Book (includes the interpreter's

actual source code)

Mapping the Atari (good Atari memory guide)

Compute's First Book of ATARI GRAPHICS

Inside Atari Basic

101 Programming Tips & Tricks for Atari Home Compuers

Atari - An Invitation to Programming 2

Atari - An Invitation to Programming 3

Understanding Atari Graphics

Advanced Atari BASIC Tutorial

Manuals for AtariWriter, Text Wizard, Atari 1050, Atari

DOS 2.5, Atari 130XE, Atari 1200XL,

Assembler Editor, Percom Drives, Macro

Assembler, PRINT SHOP, Kyan PASCAL,

Atari BASIC, ICD P:R: Connection, ICD

SpartaDOS

Atari "Demopacs" (#1 - #8, info on Strings, Data Files,

Programming, Color Graphics, Advanced

Graphics, Advanced System Features, etc.)

I can handle moderation - either manually or automatically. That's the
easy part. Getting the RFD accepted and passing the CFV is tough.

I sought to respond to this and saw all the newsgroups this cut across:
news.csd.uwm.edu/comp.os.ms-windows.nt.advocacy
news.csd.uwm.edu/comp.os.linux.advocacy
news.csd.uwm.edu/comp.os.os2.advocacy
news.csd.uwm.edu/comp.sys.amiga.advocacy
news.csd.uwm.edu/comp.sys.atari.advocacy
news.csd.uwm.edu/comp.sys.next.advocacy
news.csd.uwm.edu/comp.unix.advocacy
news.csd.uwm.edu/comp.os.ms-windows.advocacy

So if this thread no longer applies to your group, SORRY!

Listen people, this is my take on the situation of this OS vs. that OS:
UNIX (the plain Jane variety) is confusing, obtuse, archaic and downright confusing.
So, there's NeXT, Linux, etc. to alleviate the command line confusion ("what do I type?" again, Better check UNIX for Dummies!) Personnally, a) I can't wait til they port Linux to my particular PPC and b)if I've got the money next month, I'll buy a NeXT cube regardless of its "obsolescence". It's just too cool!
DOS-based; EEK! get away! I'm warning you! I've got a gun! No but seriously, my Windoze friends assure me that it works great for them, but then again, they're
all hopeless hackers and like messing-up systems and writing viruses and such.
PPC/PowerMac, well the long & short of it is- I'm biased! When my wife and I looked at our options our only real option was the Mac, our decision was totally need based-no other platform did what we NEEDED.
And honestly, I credit my now burgeoning interest in computers to Apple and Apple alone. Our college has plain Jane UNIX and it was so un-intuitive my interest in computers was squashed for the first 2 years at college.
OTHER:Apple II, Amiga, Atari, TI, ad nauseum. Well , I was given a //e and bought a IIGS for dirt cheap...now I'm teaching my self BASIC and PASCAL-hey if you doubt their usability check out what a serious A2 user is doing-4 years obsolete & they're still going pretty strong. A German compnay is even releasing a "Modern" Apple//e for $150 U.S. Amiga...well do I really need to say anything; another company is attempting to revive the Amiga w/a newer chip (check the Motorola site for details).
If I missed anyone, just chalk it up to inexperience.
PPCP-makes much of this irrelevant, last I heard it'll run MacOS, WindozeNT, OS/2, Linux, AIX, and others as they become ported, hell, rumour is even the AmigaOS will even be ported to the PPC!

So I suppose the long and short of it is-Mac for ease of use, UNIX for "raw" power, and -whatever- for the compromise situation. If I won a Windoze 95 machine I'd keep it and try to learn how to use it to see first hand what all the grief is about, but I'd never buy one. That's simply a personnal choice based on
observations, other users opinions and what I've read about it from the "pros" e.g. the IBM site has it's 15 q's to ask M$ about the 95 and basically lambasts it,
legitimete(sp?) complaints only.

"Try browsing 10 hours in my OS" seems to apply before people gripe about other OS's they obviously never used.

criostoir

5142. To the infidel, Haley...

X-News: cobra.uni.edu comp.sys.atari.advocacy:14360
From: khaley@nova.gmi.edu (Kevin Haley)
Subject:Hey Peter! The Ship is Sinking!
Date: 1 Apr 96 14:38:15 GMT
Message-ID:<khaley.828369495@gmi.edu>

AHAHAHA! I wouldn't normally laugh at this kind of thing, but because
it has to do with something so near and dear to you, I just can't
resist.

Why don't you tell us about Apple, Peter? Where should I start?
Perhaps with the fact that Apple is going to take over $700 MILLION
in losses? Seems that Amelio is going to attempt some huge one-time
write-offs and losses to get the company back in the black again.
But this is gonna hurt. Really bad.

Kinda reminds me of the Atari of the mid-80's.

Also, Moody's downgraded Apple to JUNK bond. And industry analysts
don't expect Apple to see a single profitable quarter this year?

And what's this I hear about a significant portion of the losses
to be taken are from back stock and inventory? I thought Apple's
computers were selling like hotcakes? I think this mess is more from
mismanaged inventories than back-orders. Apple was just trying

to sugar-coat the situation, now the truth becomes known.

> That stock has done wonders for the higher ed channels. Our campus reseller
>has saw sales tripled with the dollar amount over a million.

I was at CompUSA Saturday, and I watched the PC and Mac displays for
a while. What a contrast. The PC section was filled with consumers
(I counted 19), while the Apple section was neglected, only 3
customers were there (and 2 were kids!). Nice stacks of Macs here,
too, you can't blame sales shortfalls on lack of stock.
Apple has a long and rocky road ahead of it. No doubt Peter will
respond to this, and tell me about how things are turning
around and that he has info that he can't disclose and how I'm in
denial. Yeah, sure, whatever you say, Peter. Should I compose
your response? I'd probably spell it better than you.

>That stock will most likely be pushed into the higher ed channels which has
>been the case at our reseller.

This is just so ironic. Peter flames us Atarians for
being on a sinking ship while the moron can't see that his

own ship is sinking! AHAHA! What a fool.

>He he he..The ship is floating, thank you. Now whoo is a DUMBASS nnow?

See you on the bottom, Peter.

0> I will see you on the top..

/Kevin

> Any thoughts?

I have a proposal all written up. It was already shot down in flames
after being submitted to the group mentors, but I am more than willing
to let someone else have the text to modify as they see fit.

Getting 100 votes is the toughest part - but I think it's likely to be a
lot easier now than it was before I brought the subject up in the entire
comp.sys.atari.* tree. I suggest a "straw" vote - who wants to be the
vote-taker? We will probably want to take a straw vote on each of the
following points:

Should comp.binaries.atari (all systems) be created?
Should comp.binaries.atari (all systems) be moderated?
Should comp.binaries.atari.8bit be created?
Should comp.binaries.atari.8bit be moderated?
Should comp.binaries.atari.st be created?
Should comp.binaries.atari.st be moderated?

I suggest that, if we can find a vote-taker, and if we can garner 100 or
more votes in favor of any of the above "straw" proposals, that we then
submit the formal RFD and try for the group. I'd also recommend a .d
group (discussion) be part of the proposal for each binary group
desired, so as to keep binaries and discussion seperated (in
consideration of those who'd like to discuss the matter but don't have
selective download ability).

For most of the OS flamers, it's basically an emotional insecurity issue. Some people incorporate external factors such as who they associate with, what brands of clothing they wear, what car they drive, or, in this case, what OS they use, very tightly into their definition of themselves. Therefore, using an OS other than the one they've chosen to identify with directly challenges their perceived levels of computer expertise, at the minimum, or their whole sense of self-worth, at worst. Fortunately, most of them outgrow it once they discover other things to add meaning to their lives.

j>
j> Well, all the ones *I've* ever seen.

Old thread, sorry, I just got time to consider this.

MS-DOS doesn't support a mouse. You have to run a third-party mouse driver, eating up precious "conventional" memory (and there's another reason for avoiding MicroSlop products - at home, I don't have to wonder which "type" of memory a given program needs).

Novell Netware doesn't support a mouse. Period. There are no third-party drivers, or any other way AFAIK, to add the facility.

Win95 supports some mouses but not others. If you happen to have one it doesn't like, you're out of luck.

I could go on, but frankly, who cares? I have an assortment of OSes available, and I use the one that is best for the purpose at any given moment.

5150. The 040 ST clones are poor/price ratio!

Newsgroup: comp.sys.atari.advocacy
Date: 1996-07-21 00:00:00 UTC
From: sinclap2954@cobra.uni.edu
Message-ID: <1996Jul21.224655.1@cobra.uni.edu>
Source record: 8809

The new 040 clones will be a flop because the price/ratio is poor. For less money, 200 mhz Powermacs and Pentiums can be had plus the ability to use inexpensive CDROM encyclopedias such as Groiler, Encarta, Worldbook and many more. Plus high quality and inexpensive browsers are not available as well.

GREETINGS..

Yes, nice..
Shut up your Mac and buy a Pentium...
And please, chance the newsgroup!!!!

Buy a clone, the rest will be cheaper for all other buyers..

(It's much better for all atarians)

regards, robert

I absolutely agree with much of what your saying, Peter.
---
1) Inexpensive Web browsers are not available. We have to deal with
non-expensive (free) ones like CAB, STiK, and the like.
---
2) Groliers isn't available - directly. We need to use Sara. Of course,
that will drive off all the people who use computer encyclopedias to get
work done every day.
---
3) The clones weren't designed to cater to the hard-core Mac fanatic or
PC bigot. They were designed to appeal to folks who need high-performance
versions of the TOS OS for its unique and legacy applications.

Capice?

Musical Contest "Musica con Atari" - Announcement of competition

Art. 1 - Announcement of competition
Published and unpublished songs can partecipate at "Musica con Atari"; all songs must be sent not after the 31st October 1996 at:
Emmesoft Via San Donato 49 10144 TORINO (ITALY)
together with the registration fee of 33 (thirtythree) U.S. dollars for each song sent (a maximum of 2 songs are allowed for each Section). Money can be sent cash, via international post or bank transfer.
Registration fee can't be returned.
Art. 2
"Musica con Atari" Musical Contest is reserved to every musician (even outside Italy), hobbyst or professional. Competitors must be age 18 or over.
Art. 3
Competitors can partecipate with one or more song. Maximum duration allowed for each song is 6 minutes (for the "Classic Section" 15 minutes). While sending the song(s) musicians must include a little curriculum with their full address.
Art. 4
Sections available are:
Arrangment (songs not composed from the competitor, but rearranged in a creative way)
Original Compositions (original works composed by the competitor)
Classic (transcription of classical scores)
Transcriptions (famous songs faithful transcription)

All songs must be in MIDIFile format standard General Midi. Magnetic tapes or digital formats (DAT, CD ecc..) are excluded.
Art. 5
Jury is composed by 5 members. After the competitive examination of all the songs received according to the terms of art. 1 the jury will, at his unobjectionable decision, award the prizes given from the sponsors. The 4 winners of the Sections will receive the prizes during Atari Days.
Art. 6
All winners will be promptly informed to be able to be present at the awarding of the prizes. International winners are not obliged to be phisically present during the awarding of the prizes. All delivery and shipment costs to send prize to the address of international winners will be at winner's own expenses.
Art. 7
Jury's verdict is definitive and inappellable. While partecipating at the Musical Contest competitors of the prize will bind themselves to accept the final verdict without rising objections. This announcement of competition is in English and Italian and is composed by 9 (nine)

articles. For every controversy will be competent the Torino Court and the italian laws.
Art. 8
All floppy disks sent, at the end of the Musical Contest, will not be sent back.
Art. 9
Jury will examine all the songs received in the days 8th and 9th November 1996. During Atari Days the Atari press will be informed of the name of the winners.

Musical Contest "Musica con Atari" ENTRY FORM

Messrs. Emmesoft,
the undersigned _____
born in _____ date of birth _____
address _____
_____telephone number _____

encloses herewith a floppy disk containing the followings MIDIFile standard General Midi songs (please write songs' title and author):

_____
_____
_____

asking in this way to partecipate at the Musical Contest "Musica con Atari". The undersigned asks to compete with the above mentioned song(s) in the Section (please tick the preferred section; if You partecipate with more than one song please state the section even at the side of the titles You have already indicated):

_ Arrangment (songs not composed from the competitor, but rearranged in a creative way)
_ Original Compositions (original works composed by the competitor)
_ Classic (transcription of classical scores)
_ Transcriptions (famous songs faithful transcription)

All songs must be in MIDIFile format standard General Midi. Magnetic tapes or digital formats (DAT, CD ecc..) are excluded.

The undersigned encloses herewith:
1- floppy disk containing the indicatedMIDIFile standard General Midi song(s)
2- payment of 33 (thirtythree) US$ for each song sent. Payment can be either done at:

A-Postal Account 34999102 or
B-Bank Transfer: Banca S. Paolo di Torino - Ag. 3 TORINO account number 150224

to:
Emmesoft, Via San Donato 49 10144 TORINO (ITALY)

PRESS RELEASE
Atari Days
Announcing the 3rd Edition of the italian Atari Fair

TORINO - 16th july 1996
Emmesoft, the most important italian source for Atari products (located in Torino-ITALY), announces the third edition of the italian Fair for the Atari market, called Atari Days.
This Fair, which has been held for the very first time in December 1994, takes as example similar events periodically held in Germany, France, England, Sweden and USA; Atari Days is the right place to show and demonstrate all latest products and releases for Atari and Atari compatible computers.
The first two editions have had a good success, while this new edition will benefit of all suggestions from distributors and developers to improve Atari Days.

Atari Days - General Information

Where & when
Atari Days will be held in Torino (ITALIA) from Saturday 16th to Monday 18th November 1996; the most important innovation from the last edition is the number of opening days, three insted of two, to grant wider access to the people.
The selected site is the same of the previous edition: the central Hotel Holiday Inn (Via Assietta 3, in front of Porta Nuova's railstation).
The entrance will be ticket regulated (opening hours 10-18) while distributors and dealers pre-registered will get free entrance to the Fair.

First Edition of the Musical Contest
"MUSICA CON ATARI"
Since Atari computers are still strongly used in the musical field, during Atari Days there will be the Musical Contest "Musica con Atari", with over 3 millions Lit. (2.000 $) of prizes.
This Musical Contest is reserved to every musician (even outside Italy), hobbyst or professional.
"Musica con Atari" is sponsored by the most important companies in the Atari market. Between them are:

Charlie Lab
Steinberg
Emagic
C-LAB

Between the prizes awarded are a MIDI Digitar Midi-guitar, software Cubase Audio, Notator Logic sequencer.

For more detailed information and/or to receive the announcement of competition in English (the deadline to send the floppy disks with MIDIFile in General MIDI standard is 31th October 1996) please contact:
Manuela Esterni - phone +39 337 226379 fax +39 11 4374311
e-mail: atarimag@mbox.vol.it

The awarding of prizes of the musicians winners of "Musica con Atari" will be during Atari Days. N.B.: International winners are not obliged to be phisically present during the awarding of prizes.

Reserved AREAS FOR EXHIBITORS
In Atari Days people will find booths for demonstrations of new products and latest releases.
The major distributors and developers in the italian Atari market, together with distributors and international developers, the italian magazine "Atari Magazine" and the french magazine ST MAG will exhibit during the Fair.

Reserved AREAS FOR WORKSHOPS
During Atari Days ther will be Workshops about graphics, MIDI, Multimedia,MIDI etc...

What's new during Atari Days *
Falcon MK-X from C-LAB, the new rack mounted model, based upon licensed Falcon030 technology from Atari Corp.
Falcon Studio II, the all-new Falcon based digital audio workstation
Hades the new version from the Medusa family, with Motorola 68040 processor , 8 Mb RAM and 1.2 Gb Hd
Lithos scan: professional software for Agfa scanners with "direct to disk scanning"
Karaoke Voice Wizard: the latest release from Jurgen Schwietering (of Steinberg fame) of the most powerful Karaoke software for Atari
Notator Logic 2.5: the long awaited upgrade of one of the most famous MIDI sequencer in the world
Yamaha CD Audio Mastering : professional system for mastering Audio CD with Falcon e Cubase Audio
Afterburner, 68040 accelerator board for Falcon
MagiC 5: the latest release of the multitasking OS for Falcon
MagiC Mac e NVDI Mac: Atari emulator for Mac
Gemulator Gold e Laptop: Atari emulator for Windows 95 and for notebook PCs
Background Photos 2: the new all-italian professional textures CD ROM, volume 2

SNEAK PREVIEWS DURING Atari Days
Internet linking with Atari Magazine. Visitors will be able to "chat" with the most important developers from USA Germany, France and England
News on line ON-line newsreading, with the writers from "Atari Magazine", of the latest news for Atari
World Wide Web exploring, net-surfing of the Atari world on the WEB
Atari Club, meeting with the local Atari users' groups

Why should I attend/visit Atari Days ?
+It's the only one Fair of its kind in Italy!!

For more information:
Atari Days
Manuela Esterni Tel. +39 337 226379 FAX +39 11 4374311
e-mail: atarimag@mbox.vol.it

You're railing on upon the cost competitiveness of ST clones is
perversely ironic.

You are only railing against the vendors(s) you support so much.

Isn't ignorance (petey-boy's) grand?

All of these are red herrings, in that they are _NOT_ HTML-complaint
standards. Thus, frames break on Lynx and a number of other HTML-compliant
browsers. Anyone can design a system and decry other browsers that aren't
compatible with that system. It takes real common sense to adhere to the
HTML specs and extend THOSE.

With Peters piss-poor logic, I could argue that the Mega ST4 has a better
price/performance ratio since the latest version of Netscape cannot view
CVG and STG format pictures. It really is quite a lame argument.

Again, none of my real points are addressed - about the target market for the
ST clones. The target market for a ComputerDirecTT or a C-LAB Falcon Mark X
is the TOS user who wants more horsepower for his computer. The market for
Macintosh is the user too stupid to buy and use a real computer, and too
ignorant to realize he is paying hundreds of dollars too much for what he
is getting from a dying company that has to write off inventory (and one
third of its net worth) due to collapsing sales.

In five years, Peter will be writing messages in Mac advocacy about the
"Apple jihad", and will be extolling Windows 99. He seems to have a penchant
for this sort of thing - never satisfied with what he's got, or satisfied
with the notion that other people can be, and have different needs (and views)
than he does.

: Will okay.. Next month at MacWorld, Umax using the Supermac label will release
: a 140 mhz Mac OS clone complete with 16 megs, 8x CD and 1.2 gig for $1500...The
: PPC 603e will be on a daughter card. Isn't competition grand?

Yeah ... for the consumer. I don't think Atari really cares a
whole lot about machines like that.

: The 040 hades is $3000 or more..Why does it cost twice as much or more and does
: less?

I said the same thing when the Mac512 came on the market. :-).
Did you ever think that maybe people like the computers they have? Maybe
they've invested so much in software and hardware peripherals that it's
not economical to buy a whole new system *AND* all new software? Or that
maybe, just maybe, the ST is the best machine for what they need? Hmm ...

HTML is not the only standard out there. Supporting Java and, to a lesser
extent, Shockwave should be goal of any browser creater. I beleive that
frames and tables have been added into the HTML 2.0 standard.

>With Peters piss-poor logic, I could argue that the Mega ST4 has a better

How can you spurn Apple as a dying company while rationalizing the purchase
of an Atari clone? What would have consider a real computer? A HP workstation,
an SGI, an Alpha? A PC? An Atari?

: >compatible with that system. It takes real common sense to adhere to the
: >HTML specs and extend THOSE.

: HTML is not the only standard out there.

But HTML is a standard --- to an extent. Companies like Netscape,
which propose extensions and then integrate them into their browser
before they are approved, have cause serious problems in the development
of HTML as a markup language. For example, © is the symbol for
(c). It's fairly widely used. But it isn't standard, and a lot of
browsers (including Lynx) don't support it.

Another problem is the inclusion of incomplete standards. Netscape
has included tables and so on. These, fortunately, complied with the
draft standard at the time. Unfortunately, something incomplete should
not be implemented because it leaves no room for change when the
implementation is in a major browser such as Netscape. People see that
tables are supported and start doing it the Netscape way, even if the
standard changes and the Netscape way becomes the Wrong Way. When the
Netscape way does become the Wrong Way, [l]users complain that the
standard doesn't have the implementation of X thing the right way, and
that the Netscape way is undoubtedly superior and works better.

: Supporting Java and, to a lesser extent, Shockwave should be goal of
: any browser creater.

Not always. Java and Shockwave are not officially part of HTML, and
while they are certainly useful, they need not be implemented if the
author doesn't feel like it.

: >With Peters piss-poor logic, I could argue that the Mega ST4 has a better
: >price/performance ratio since the latest version of Netscape cannot view
: >CVG and STG format pictures. It really is quite a lame argument.

No, the argument would go something like this: "The Atari 400 is
obviously superior to the PPC 604 and Pentium MMX chips, because they
don't have 6502s." :)

: You could argue that having no CVG and STG viewing capability is a liability.
: But you would be wrong.

Really? What if he has an image in CVG or STG format he wants to view?

: I have never seen these types used on the web.

That doesn't mean that they're not useful.

: I have seem Java, Shockware, Realaudio, frames and tables.

That doesn't mean that they're useful.

Collapsing sales? I think not and according to last quarter results. What is
a real computer? A real computer is that you can take it out of the box, plug
in the monitor, chord and turn it on and get productive? Or is a real computer
is spending weeks to configure and make things right? The choice is yours..

q>
q> I think that he was arguing the quality on this one. Like supporting
q> the lastest HTML standards <snip>

If you're referring to the Netscape extensions to HTML, they aren't officially "standards" yet. HTML 3.0 has not been ratified. And MS Explorer has their own proprietary extensions, so it looks like MicroSlop is going to try to create yet /another/ HTML "standard" (which brings to mind so many MS jokes that I can't begin to list them).

CAB /does/ support the standard, HTML 2.0 - anything beyond that is proprietary.

5174. Apple is doomed!! The Mac is poor/price ratio! :')

Newsgroup: comp.sys.atari.advocacy
Date: 1996-07-29 00:00:00 UTC
From: Brian-Roland Miller <brimiller@delphi.com>
Message-ID: <RZHuXbl.brimiller@delphi.com>
Source record: 8833

Well, well, looks like Peter's denial of Apple's collapse in sales is
about to be brought to an end - check out this interesting info:

Dataquest said that troubled Apple Computer maintained its number three
position in the world, but its market share slipped to 5.3 percent and unit
More?
volumes fell 16.7 percent to 840,000 units, down from a 7.4 percent share of the
world market and units of 1 million a year earlier.
"Volumes are slipping sequentially, so that makes the current quarter really
key," said Dataquest's Brown. "If they slip again sequentially, then it's a
problem (at Apple)."
Brown said that Apple has put in the proper measures to strengthen its
balance sheet and return to profitability, but he said the September quarter,
which is the back-to-school quarter, is a crucial one for Apple.
IDC's U.S. data for Apple ranks the Cupertino, Calif. company as fourth in
the United States, with 410,000 units and a drop of 21 percent in shipments,
from 522,000 a year ago. Its market share dropped to 6.9 percent, from 10.3
percent a year ago.
"They have had a lot of problems and customers are holding off buying and
others have decided not to buy (Macintoshes)," Lewis of IDC said.
He said he is looking for the November launch of a new line of Performa home
computers to help Apple, because its home product line has "fallen behind the
times."

So. . .

1) Unit sales of Apple computers in the US market have dropped
21 percent, and in the world market, 16 percent - more of a drop in a
single period than Commodore or Atari ever had. In fact, only Coleco
comes to mind as a computer maker with a more severe sales drop.
---
2) Apple's home PCs are behind the times, and customers are
holding back from buying until better news comes around.

Seems to me that Peter will be bashing Mac users in five years, extolling
the virtues of Windows 99.

I'm glad I didn't fall for the Macinflop, or the Apple Jihad! :')

Apple Computer - the denial ability of S&L managers, the financial
security of junk bond funds, the technology of yesterday.

BR Miller
Boston, MA

If this isn't a flame troll, I don't know what is! Let's see how Petey likes getting soe of his own medicine, mixed with FACT. FACT is, his precious Apple Computer is plunging down the toilet at a rate several times faster than Commodore and Atari.

Thats great for you but a lot of people like Java applets, Shockwave and
Realaudio. And any computer can do PPC data transfers and text conversions.
Macs and PCs also have good web tools along with the Atari.

Send me a couple of interesting images in those formats and they'll be posted on the Web at http://www.3rdplanet.com/~starship

>: I have seem Java, Shockware, Realaudio, frames and tables.
>
> That doesn't mean that they're useful.

Java script works on my wife's system (486DX4/120, 24 megs RAM, 28.8 modem, s-3 SVGA VLB w/2 megs VRAM). Readlaudio doesn't. CuSeeMe doesn't. Netphone doesn't. Frams and tables do, but tables work on my 1040ST under CAB, too. That computer cost me $60. We spent $1500 on /upgrades alone/ on the 486 last year.

Not all the stuff that's supposed to be so wonderfull on the Web works for everyone. Intel's newest webphone works ONLY on fast Pentium CPUs, for example (I could have gotten a preview copy from the developer down the hall, but we don't own a Pentium). Being swamped in useless features doesn't make a product "better," either. Apparently Petey-boy finds spell-checkers useless, but as I recall, all Mac software is interoperable, so he /could/ (and certainly should) use it, if he could only figure out how.

What's useful depends on the requirements of the user, not on the Marketing pinheads in Redmond or Cupertino. I need a machine that can do PPP data transfer and convert one type of text file to another rapidly. My Mega STe does that admirably. I also need a machine that can edit HTML and view the results. My 1040STfm does that well (and shows me where the HTML code is not 2.0 compliant, as well - which, under Netscape, I would have to test on-line at a Web site, since there's no way to turn /off/ the Netscape-specific "features").

And when I want to play games, my wife's 486 does that well. Eventually, I'll get a Falcon, because it will do all of that (although I'll keep the MSTe as the mail server, and my wife will keep her 486 because, well, she's a Luddite at heart <G>). But for now, we use the computer that does the job best for the appropriate job - with the appropriate software. In other words, I don't use a chainsaw to carve the pot roast.

Did you read the same last quartes (Q3) sales as me? IIRC the units
sold was down 15 0.000000rom the same time last year and just about matching
the last quarters. Admittedly not collapsing this quarter in
particular but certainly dropping.
I'll mkae myself clear on this one Pete, I don't hate MAc's or Apple,
I have a Newton and am considering a Mac, *BUT* I can not stand you
completely slagging off quality machines like Ataris (with lies) and
making Macs out to be perfect wonder machines (lies agin), just play
it staight and you might make your first friend.

>What is a real computer? A real computer is that you can take it out of the box,

: That's like selling a development tool without a debugger. They are certainly
: useful but since they are not neccessary, "they need not be implemented
: if the author doesn't feel like it."

That analogy isn't very useful. A debugger is considered to be almost
standard; it's not required, but you're certainly missing something
without it. Java and Shockwave are extensions; they are possibly useful,
but they are certainly not required.

: > That doesn't mean that they're not useful.

: A viewer for something that I will never need to view is not useful.

...but only for you and others in your situation. If you decide that
you will never need a certain file format, that does not mean that that
file format should go completely unsupported.

: > That doesn't mean that they're useful.

: They are useful if you want to view most of the content of the WWW.

"most"? I have not encountered very many pages which make use of frames (unfortunately, the authors of most of those don't realize that there is a world without frames --- another problem with non-standard HTML) and I don't recall ever seeing a page which use tables.

Not really. If developers didn't actually try to implement things then
developments would be put in comittee limbo instead of being useful to
end users.

Frames and tables are "almost standard". Netscape and Internet Explorer
support them and that's 90+% of browsers.

> "most"? I have not encountered very many pages which make use of

My "most" I mean that with a web browser that supports HTML 2.0 + Java +
Shockware + Netscape Extensions then virtually all pages will be viewable.
For an example of tables, go no further than my Universities home page:

he he he. You did not read the report entirely. They stated that Apple's sales
decline has bottomed out and new products may accelerate sales once again.
Also noted that the press fud and the recall of the Powerbooks impacted sales.
Once the powerbooks are stocked in the channels willl increase sales.

> 2) Apple's home PCs are behind the times, and customers are
> holding back from buying until better news comes around.

I would. I was never a fan of the Performa line. I thought they were crippled
technically. However, the prices my reseller has them for is a steal. The
6400 should change things along with the new clones.

Shockwave and Java, while really nice "bells and whistles," are /not/ an
industry standard. And there is no "fully HTML 3.0 compliant" browser,
because there is no HTML 3.0 /standard/ as of yet; the standard hasn't
been approved.

And your argument wasn't? We have a difference of opinion here - and
opinion is not fact, is it?

>Technology progresses. Everyone takes the chance that new technology
>won't be supported on their old hardware. But Peter is correct in
>saying that Mac and PC users can expect better support, as far as
>Net technologies, than Atari users.

If you say anything that happens to occur to you, sooner or later one is
bound to be correct. Peter has spouted literally reams of mis- and
disinformation in this (and other even less appropriate) forums. His
opinions are founded on /advertising,/ which is the exact opposite of
/facts./

It is a fact that there are far more developers for the PC than any other
paltform. They all expect mountains of money for their most mediocre
efforts, and historically, they have reason - PC users will apparently pay
for /anything/ (witness the continued success of one of the poorest
operating systems/user interfaces on the planet - need I name it?).

Macs have a far smaller developer pool, but their apps are also usually
priced up ther with the "Cadillacs" of software, because the Mac has
historically been a high-priced machine in comparison to similarly-capable
platforms; thus, the market tends to expect to pay more. There are some
notable exceptions to this in the Mac shareware/freeware area. One of
them is Free PPP, and it's actually better than the "official" PPP layer
from Apple Corp.

Atari has the smallest developer pool of the three platforms. However,
the developers are. as a rule, fanatically devoted to making their
applications run in the smallest possible resource pool, and they pump out
bug fixes and updates far faster than Micro$loth pumps out bugs. Finally,
the cost of equivalent applications is usually far less for the Atari/TOS
platforms than for the Mac or PC.

>>What's useful depends on the requirements of the user, not on the

..
>
>Thats great for you but a lot of people like Java applets, Shockwave and
>Realaudio. And any computer can do PPC data transfers and text
>conversions. Macs and PCs also have good web tools along with the Atari.

What people like and what they need are usually completely disparate. I /like/ Rocky Road ice cream. I definitely don't need it. And, like ice cream, an excess of "things I like" makes for "fat" Web pages which take forever to view even with a 28.8k modem and take up enormous amounts of storage space. I'm not saying no one should use Shockwave or Java - I'm saying that /judicious/ use can /enhance/ a good page. Indiscriminate use can make a mediocre page absolutely unbearable.

Finally, let me note that I never said that Macs and PCs can't do PPP (or, in your words. "PPC") data transfers, or text conversions. I simply see no reason to devote a $3000 computer to doing what can be done on a $500 computer. It's called "appropriate technology." Don't carve the pot roast with a chainsaw, eh?

CAB Supports tables, and they are used extensively at my site to help ensure the data is presented in an organized fashion. However, I have been having problems the past week accessing my site via a dial-up connection. It's no problem from the T1 line here at work, though; perhaps you can get in and take a look.

>He is correct that Macs and PCs have support for more net technologies.

Of course he is. But he didn't get that fact from research or experience (it's a wonder he managed to get a fact at all, if history is any basis for judgement); he is simply spouting MacGospel. There's nothing wrong with Macs as a whole (if I could have either a Mac PPC or a Pentium under MS-anything, the P5 would lose hands-down simply because I hate MicroSlop), but that doesn't mean they are always the best or only solution for a given purpose. They make lousy network servers, for example, because MacSystem is even slower than Novell for most file access. OTOH, for DTP I would rather have a Mac than a PC. And, for my own software, I want a TOS-based system because (a) it's inexpensive (paid for already, in my case) and (b) more than adequate for the job I want to do.

>I would probably use a XT if all I need to do was text conversions
>and PPP. But I also want to view Java applets and director files.

I think I'd be pretty unhappy with an XT for anything but formatting disks and running McAfee - which is all I use the one here at work to do. Both are slow tasks by the nature of the medium. When it comes to mutlitasking, my MSTe at 16 MHz outperforms the 20 MHz XT by several orders of magnitude. I suppose if I wanted to spend money on DesqView, that might change, but since all my Atari/TOS Apps are paid for, using an X86 system would be a new, major investment. Again, appropriate technology. My 28.8k modem is the bottleneck, so putting a DEC Alpha on line would not significantly speed up what the MSTe does; an XT would slow it down.

"Standard" is, in this case, a list of specifications approved by the
standards committee. Since the committee has not yet released an approved
list of specifications, there is no standard. Q.E.D.

I can't think of any computer where that essentially isn't the case now.
Most machines are plug-in-able. It's when upgrades come along that things
get hairy on the PC.

Wow, you win the award of excellence for stating the obvious. Peter is
correct - but he also is insisting that people pay more. You get more
support, but you pay more in software, frustration, and hardware. A
starter Mac from ComputerTown is $2000. Starter Falcons cost much less.
And the software for Internet access is free.

>Thats great for you but a lot of people like Java applets, Shockwave and

Which is also wonderful - but over 30% of Web users cannot view _ANY_ of
these formats. Why should lynx, Amiga, TOS, and other users be forced to
surrender the ability to view HYPERTEXT info because of the lack of Java
tools that make eyes on a picture blink?

Sorry for not paying attention but I'm fairly sure that you are wrong.
I think that any 486 or better (and that's not really "contemporary" in
my mind) can use Java or Shockwave. I don't think that the Atari can.

> As long as GNU exists, any REAL standard should be viably supportable
> on the ST (or any other machine for that matter).
> Java shouldn't be much different than the Hisoft C interpreter...

It seems that I've lost the standard battle so I'll try a new approach...
even if something is not a standard, if many other vendors support it and
users want it, then it is worth supporting.

> ...and even more people, PC using people AND Mac using people think they
> are, for the most part, useless, bandwidth wasting, toys.

The WWW is mostly a waste of bandwidth but still we use it because there
are definately some useful things on it. There is a really cool Java
applet (it's fairly small I think) that let's you interactively play
with JPEG conpression settings. It's pretty handy if you want to hand
tune the compression matrix.

Java applets tend to be fairly small. It's the graphics that they need
that tend to be large. But those applets are usually useless anyways.

There should be no one standard browser but I think that the Atari platform
is being hurt by the lack of support by any big browswer maker.

I was actually running it on an SGI a while ago. I'm sure that you can
find it by finding the HTML 3.0 committee's page and looking for a link.

>
>That's like selling a development tool without a debugger. They are certainly
>useful but since they are not neccessary, "they need not be implemented
>if the author doesn't feel like it."

No, development is not done under WWW browsers - viewing is. While it's
good to support every standard out there, ancouragement of a hodge-podge
of standards can create situations in which _NO_ browser can view all info
freely available. That's not accessibility - that's stupid.

For example, if I put up a page that used only STG bitmaps and CVG vector
images, I would be blasted for a "non-standard page." Great, and correct.
But complain about a "standard page" that requires a certain brand browser
"to view it correctly", and you're booed. In the WWW, "Netscape NOW" and
"MS Explorer" download options shouldn't be the rule. These things
are platform-specific and proprietary - both ideas that the Internet
is supposedly supposed to counter.

Is the original poster trying to say that Peter's obnoxious comments are hurting the Mac because Atari users will associate the Mac with him? Or is the original poster trying to say that the same points that make the Atari uncompetitive also make the Mac uncompetitive. Or is the original poster trying to say that the points, given my Peter, do not apply to the Atari but do apply to the Mac. Please donate a clue.

You aren't paying attention. A fairly contemporary clone is being
left behind as much as any ST.

As long as GNU exists, any REAL standard should be viably supportable
on the ST (or any other machine for that matter).

Java shouldn't be much different than the Hisoft C interpreter...

Considering that the maximum data thruput on an analog modem is
4 Kilobytes per second and even a lowly XT should be able to
manage CPU-RAM thruput of 4Megs/second, even a lowly XT should
be able to handle the task if programmed properly.

Cases in point: GEM/86 & QNX

Otherwise the tasks are beyond the capabilities of a conventional
modem and are therefore red herrings.

Depends on the medium. CCIT sets standards for telecommunications, EISA and
ANSI For lots of 'lectronic thingies, UUnet for Usenet... Internic is the
repository of standards documents for the Internet, though, so if they don't
have such a doc, it's not an Internet standard.

: >in the best possible way.

: Not really. If developers didn't actually try to implement things then
: developments would be put in comittee limbo instead of being useful to
: end users.

"limbo"? Standards committies don't just sit around. They work to
create a useful and useable standard. By bypassing that process, we are
subject a flood of useless, unstable, unusable, and incompatible
"extensions". Once these things become standards, we _know_ that they
are useful, tested, and universal.

: > That analogy isn't very useful. A debugger is considered to be almost
: >standard; it's not required, but you're certainly missing something
: >without it. Java and Shockwave are extensions; they are possibly useful,
: >but they are certainly not required.

: Frames and tables are "almost standard".

What is "almost"? Say 99.0% of browsers support the <foo> tag. Is it
standard? If it is, is it still standard at 98.999...% of browsers? At
98.0%? 97%? 95%? 90%? 75%? 50%? 0%?

: Netscape and Internet Explorer support them and that's 90+% of browsers.

Translated: "What's popular supports them, so it must be good." I
don't quite think so.

: > "most"? I have not encountered very many pages which make use of
: >frames (unfortunately, the authors of most of those don't realize that

: >HTML) and I don't recall ever seeing a page which use tables.

: My "most" I mean that with a web browser that supports HTML 2.0 + Java +
: Shockware + Netscape Extensions
^^^^^^^^^^^^^^^^^^^
I hear the sound of an argument failing.

: For an example of tables, go no further than my Universities home page:
: www.sfu.ca

Actually, I have to take that comment about never having seen frames back. I'm forced to use Lynx, and Lynx handles frames by stringing everything together (AFAICT, it ignores the tags because they're non-standard). I had never had a page which made it clear that they were using a table, presumably because the authors assumed that you'd be able to recognize it. Unfortunately, under lynx, you can't because it's non-standard.

5214. Computer Reporter is trying to use a Falcon, but....

Newsgroup: comp.sys.atari.advocacy
Date: 1996-08-01 00:00:00 UTC
From: radiojon@polaristel.net
Message-ID: <4tqg7v$2dc@cronkite.polaristel.net>
Source record: 8923

So, I've got this nice Falcon, fully loaded with RAM...but NO internal hard drive. I've hooked up a 640 Meg SCSI drive and bought the ICD software that is supposed to make it work. It does install all the files on the drive.

But when I boot the Falcon, it does not "seek" out the external hard drive, so it doesn't boot! I devised a work-around, where I book from a diskette, but that has another problem. When I install software, the software modifies the system files on the HARD DRIVE, not the diskette. Therefore, it does not run properly when the computer is booted, as those system files are never used.

#1. How can I get the Falcon to seek the SCSI drive upon power up?

#2. What kind of cheap little hard drive can I put inside the Falcon, mainly to hold the system files. I'll used the external SCSI for everything else.

I'd like to report more on Atari, but I'm stumped.

Thanks for your help!

It may be obvious but it is definately a point against the Atari platform.
Whether or not this is out wayed by other considerations, such as the
ones that you listed above (which I don't agree with, but that's not
important), is up to the user to decide.

>Which is also wonderful - but over 30% of Web users cannot view _ANY_ of

I bet that the number is under 30% and Java applets can actually be
useful.

Pay more for what? Mac and PowerMac hardware hardware in general is cheaper
than the 16 mhz 030 Falcon...
7200/75 is $999 which includes 4x CD, ethernet, 500 meg HD. How much for an
equivelant Falcon would cost?

As for software being more is rubbish! Thats funny, i don't remember paying a
penny for Netscape.

What are you babbling about? I am not slagging off the ST and it's percieved quality. I counter the arrogance displayed by ST users who live in fanatsy land and think that the rest of the world has been brainwashed for not selecting an Atari computer. And I do the same for arrogant Mac users as well.

> I hope that you were not implying that it takes more time to master an
> Atari than a Mac, if so then you are more ignorant than I had ever
> possibly imagined.

Actually I was implying to the wintel world. However, the Mac is alot more versatle than the ST due to guidelines in software development and how Mac software can work with another for seamless integration. Not very well done on the ST platform

Yes, Apple's sales did drop but in no way sales collapsed. Apple's sales
declined due to the recall of the Powerbook and Apple's inability to supply the
channel. The channel had 75,000 less Powerbooks and won't be fully restocked
until the end of August. Yes, Apple did screw up on the PowwerBook and is
taking more time than expected to rectify it. I fail to see the connection
with Atari and the Tramiel family.

> 2) Apple's home PCs are behind the times, and customers are
> holding back from buying until better news comes around.

You mean the Performas...I agree, I would not buy any that had a 75 mhz 603 in
it for that kind of money. However, my campus has a variation of a 6200 called
the 6214 which is nicely priced as a package. However the new Performa 6400
which are available at CompUSA despite not officially announced until Monday is
nice. If I were to buy a desktop system today, would be the new Powerbase line
from PowerComputing. Starting at $1500 for a 180 mhz 603e on a daughter card
which includes 8x CD, 16 megs HD, 1.2 GIG, 2MB video, 3 PCI slots and software
bundle is a killer...

In article <4toe83$9s7@morgoth.sfu.ca>, Brian Quinlan wrote:
: JEDI writes:

: >You aren't paying attention. A fairly contemporary clone is being
: >left behind as much as any ST.

: Sorry for not paying attention but I'm fairly sure that you are wrong.
: I think that any 486 or better (and that's not really "contemporary" in
: my mind) can use Java or Shockwave. I don't think that the Atari can.

Have you heard of Linux? Linux has kernel support for Java binaries,
and compiles on many 68k machines, _including_ STs. Shockwave, AFAIK, is
barely supported at all, even in PCs and Macs.

: > As long as GNU exists, any REAL standard should be viably supportable
: > on the ST (or any other machine for that matter).
: > Java shouldn't be much different than the Hisoft C interpreter...

: It seems that I've lost the standard battle so I'll try a new approach...
: even if something is not a standard, if many other vendors support it and
: users want it, then it is worth supporting.

That's a problem with ignoring standards; you never know what to
support. How many is "many"? How many users must want something for it
to be supported? How many other vendors must support something for it to
be supported by another vendor? The use of standards eliminates that
problem.

: > ...and even more people, PC using people AND Mac using people think they
: > are, for the most part, useless, bandwidth wasting, toys.

: The WWW is mostly a waste of bandwidth but still we use it because there
: are definately some useful things on it.

IMHO, the web is intended as a medium to transport text. There's lots
of tags to make the presentation better or easier, but the main purpose
is to transport text. Yes, forms and text entry fields can be useful,
but they should be used only when appropriately (as in search engines).

: There is a really cool Java
: applet (it's fairly small I think) that let's you interactively play
: with JPEG conpression settings. It's pretty handy if you want to hand
: tune the compression matrix.

The same could be done with a short C program, and it would probably
work better, too. Java certainly has uses, but it's nothing close to
what the marketroids are making it out to be.

Source record: 8930

The following is taken directly from bit.listserv.novell; the original author's name has been removed to avoid embarrasment for him:

<BEGIN QUOTE>

We have a number of Novell Servers (3.1, 3.12, and 4.1)

We are having problems with 4 new PowerMacs, 3 7200/90's and a 9150.
They regularly get a message that the "The Server is busy, try again later".

We have no problem connecting from any other Mac at any time.
The old Macs can connect to 3.1, 3.12 & 4.1 servers every time.

The new PowerMacs can connect to the 3.1 & 3.12 servers everytime.

Only the combination of 4.1 server and PowerMac leads to the "Server Busy" message.

I've called Apple's tech support and they promised to "escalate the issue" to Cupertino which is jargon for "We'll be sure to throw it in the garbage as soon as you hang up."

<END QUOTE>

Now, let's all follow our resident gadfly's advice and run right out and buy PowerMacs! Bwahahahahahahahaha!

Also taken from bit.listserv.novell:

"The NT DOS client lives on in the great tradition of its (all too close) MS LAN Manager client predecessor. The assumption seemed to be that you should be so glad to have a server connection at all that you didn't care about having any RAM left to do any real work."

So here we are, "limited" to 4 megs of RAM total, running multiple protocols under MiNT and even X11, while under MS-DOS with MSnet Client for DOS, I can't even run EDIT wihtout stopping the network... Yep, the gadfly is right, we should get PC/Mac computers so we, too, can enjoy the benefits of "modern" software...

I think perhaps I'll stick to "old" software that actually lets me do something useful while the network is connected, thanks anyhow.

Cases in point: US Robotics "HST" protocol. Works only with USR modems (and not all of them - it requires a Courier or DS).

V.fast - a demi-buttocked approach to getting the jump on V.34; works only with other V.fast modems, and not all implementations of V.fast are the same, so one from, say, Bullet may not be able to negotiate a V.fast connection with one from Cardinal.

Manufacturers and software publishers who go ahead and implement non-standard "features" usually end up with a whole bunch of customers who have "orphan" products. I don't include TOS-based computers under that banner simply because (1) there are still companies making TOS-based systems, and (2) alternate, "standard" OSes (e.g., Linux, Unix, FreeBSD, ad nauseum) abound. Arguments to the contrary may be directed to dev/null.

Instead of running "Install.prg", run "HDutil.prg" and modify the
A:\AUTO\ICDBOOT.PRG settings. "Install" is for a brand-new, bare drive.

>#2. What kind of cheap little hard drive can I put inside the Falcon, mainly

It should work with any IDE drive (you'll need an adapter plug/cable unless you
get a 2.5-inch drive, though).

True. But I am still glad that Sun create Java and Directory created
Shockwave. I am also glad that Netscape implemented frames before they
were supported by the HTML standard.

>For example, if I put up a page that used only STG bitmaps and CVG vector
>images, I would be blasted for a "non-standard page." Great, and correct.
>But complain about a "standard page" that requires a certain brand browser

Browser specific features are probably, in general, a bad thing. But
stardards that are open to adoptation by any browser creater are
not. Anyone can support Java and Shockware. All it takes is a lot
of work.

I am very much amused by the concept of "fully emulating MS-Windows." Let's see, we'd need to create a GUI that crashes frequently for no apparent reason, slows down operations by a factor of at least 2x, /requires/ a hard drive of at least 50 megs (and won't work comfortable with less than 120 megs), /requires/ a minimum of 4 megs of RAM to operate in the mode for which it was designed, and runs like a 2-legged dog with less than 8 megs, /requires/ a CPU running at no less than 20 MHz to be tolerable, and doesn't really get comfortable unless you have a 64-bit data bus and a 100 MHz CPU, costs as much as an entire Atari computer does these days, is badly supported (and if you have to call the publisher for help, you must pay for a long-distance call, wait on "hold" for up to an hour, sometimes longer, and pay for the support even if you bought the software), has at least 2000 "known" bugs...

You know, I don't think I /want/ to run an OS that is capable of "fully emulating MS-Windows."

OK, that's exactly 2 explicit replies. I am currently working with another person to get the proposal properly assembled; it will be announced in all of the comp.sys.atari* groups when the RFD (Request For Discussion) is posted, and again when the CFV (Call For Votes) comes around. You MUST subscribe to news.groups to particiapte in the discussions - something that was /not/ told us when the RFD to remove our previous binaries group was opened. This is a nuisance, but you'll only have to carry the group for a month or so, as a 21-day discussion period is required, and the CFV can take palce between 21 and 30 days after posting.

If anyone else has any comments, PLEASE make them now, either here or in email.

What's the URL?

I did get in touch with the Webmaster at http://www.filez.com, and he's adding an "Atari" button to the search engine there. Very nice guy, I sent him the most common file extensions for Atari archives, and Hallvard's list of Atari ftp sites.

Great. But I could make the same argument about a word processor. How
many users need to want multiple undo before I support it? Do it
need to support it to be competitive. Well I guess that I'll
wait until it's a standard.

> IMHO, the web is intended as a medium to transport text. There's lots

The nice thing about Java applets is that they are very portable and
are fairly secure.

Actually, for anyone that didn't enter the computing world
YESTERDAY, the PC-brainwashing mentality does have some merit.
Some of us remember back when the only thing a PC had going for
it was a name and Macs were more expensive than most cars.

Yet, despite all of this, people still bought more expensive
and quite inferior hardware in droves.

Admittedly, PC's finally did catch up in quality, and Mac
caught up in price (finally). However, their existence is
dependent on quite an insignificant number of original lemmings.

>need to support it to be competitive. Well I guess that I'll
>wait until it's a standard.

This is total gibberish.

As long as you support the document format, any specific editing
functions supported are quite irrelevant to any standard.

At the highest level, a web browser is a document viewer.
Once you muddle with the document format, you no longer
have an open standard. You have a proprietary file format.

You've gone from JPEG to CVG.

Oddly enough, elsewhere, you have objected to such a thing.

Or perhaps, it is more like: It's fine if those people over there
are locked out, just as long as I'm not put out.

So, in the end, instead of having something like ASCII, we're left
with WPs, SAMs, GEMs, DVIs, TEXs, EZs and interoperability goes
flying out the window...

Hmm, not much I can edit out of that. Oh, well.

If you use the service and like it, send 'em feedback. I think, like most
similar web sites, they are supported by advertising, so any feedback they get
will help them sell the site to more advertisers, allowing them to buy faster
servers and sell more ads... You know how it works. <G>

I just finished updating my Atari bookmarks page at
http://www.3rdplanet.com/~starship/atari.htm - the changes are mostly to make it
easier to get around on the pages, with some cosmetic mods and a bunch of new
links (including a new section, "References," for helping you find out how to do
STuff).

There are sections for both 8-bit and TOS-based systems. Pop in and take a
look sometime!

Consider system overhead? To you it's system overhead, to us its progress. I suppose ST advocates think the world should sit still and end progress. No sir, I won't give up Quicktime 2.5 that does not exist on that other platform.

What is taking up an extra 7.5-15.5 megs? Are you reffering to HD space or internal memory? Considering a 64 meg equipped Powermac and Pentium is significantly cheaper than the 040 Hades and also have Netscape to boot up..

The Falcon first look for an internal IDE, but since you don't have one, it
will take a while before it realizes that. It will boot from the SCSI after
a while, if you have installed ICD correctly. Use HDUTIL.PRG to set bootdrive
and some other stuff.
There is a small program, called FASTBOOT or something like that, which puts
a program on to the bootsector of a disk. This skips the check for the IDE
and it will boot faster.

> #2. What kind of cheap little hard drive can I put inside the Falcon, mainly
> to hold the system files. I'll used the external SCSI for everything else.

The standard internal drive is a 2.5" IDE. It is possible to sqeeze in a 3.5"
too but you'll need an adapter for the cable. (I think!)

I use only SCSI though, and with the fastboot program, and it's no problems!

In any discussion of cost, one must consider system overhead. For a contemporary PC or Mac, this is CONSIDERABLE.

An ST or Falcon will run in what Mac's and PC's waste!

So what's taking up the extra 7.5-15.5 Megs?

: >freely available. That's not accessibility - that's stupid.

: True. But I am still glad that Sun create Java and Directory created
: Shockwave.

There's nothing inherently wrong with something such as Shockwave, but it's use must be recognized as non-standard. It may be useful and worthwhile, but you still have to recognize the fact that it's non-standard and henceforth not required.

: I am also glad that Netscape implemented frames before they
: were supported by the HTML standard.

YM: "I am a fool." (For the acronym imparied: "You misspelled" or "You mean")

: Browser specific features are probably, in general, a bad thing.

Browser specific features are what you're advocating when you say that Netscape extensions are good things.

: But stardards that are open to adoptation by any browser creater are
: not.

Net$cape extensions are not standards. They're browser specific features. You said yourself that browser specific features are a bad thing, so why support them? Java and Shockwave can be useful standards to support, but they are not HTML standard, so they are still entirely optional.

Actually, we could go one better - get the Instant Graphics and Sound desk accessory, and I bet we can run IGS graphics over the Web. Full graphics animation with sound, hundreds of times faster transfers than QuickTime or Mpeg, and no one except Atari users can see them.

Hmmm, there's a project for next week. Start watching for http://www.3rdplanet.com/~starship/igs.htm - I think I must have dozens of old IGS files around here somewhere, and they are tiny - usually less than 5 or 6k. Thats about 2 seconds transfer time at 28800...

I disagree that something that is non-standard cannot be required. Users
decide what the requirements of a browser are. While I use lynx occasionally,
I would never pay for a browser that did not support, for example, Java.

> Browser specific features are what you're advocating when you say that
>Netscape extensions are good things.

I said "in general". I think that tables, which were not apart of the
standard when Netscape implemented them, are so powerful that it was
more important to get them out early than wait for a committee.

I'm sure that I believe this at some level. But this is exactly my point,
PC and Mac users do not have to worry about being put out. I believe that
that was Peter's original point.

>> less. And the software for Internet access is free.
q>
q> It may be obvious but it is definately a point against the Atari
q> platform.

The original point (in case anyone missed it) is that there is more software support for PCs and Macs than for Atari/TOS systems. This is mis/disinformation, actually.

There is more /commercial/ software, certainly. OTOH, most Atari users are using shareware and freeware these days by preference, and in the shareware field, Atari remains unsurpassed for both quality and range. Sure, numerically therer are more programs for the PC - but how many different videotape database programs does anyone really need?

Atari programmers are passionately devoted to making their products fast, bug-free, and "elegant" (a term that has been lost in the "fat" environment of PC and Mac systems with apparently unlimited resource appetites; it means the code is small and works in the minimum possible environment. Don't even TRY to run Win95 with Netscape 2.02/32-bit in less than 8 megs of RAM, and don't expect it to perform better than a 2-wheeled Cadillac in less than 16 megs or slower than 66MHz on a 486).

Atari systems do things in 4 megs of RAM on 15-year-old hardware that PC users had to buy new hardware for, and more than 4 times as much RAM for, last year, and Mac users are in the same boat.

If I want to connect via T-1 to the Internet backbone, I use the Pentium at work - it's hard to find a decent 100 megabit/sec Ethernet card for the Atari. But at home, I run my entire system on a 16 MHz Mega STe, and it's perfectly fine - I don't need that kind of horsepower for Web browsing at 28.8k bps, or reading news and email. The rest of the network in this household consists of 2 slightly-upgraded 1040 STs with 20 meg hard drives, and a 486DX4/120 running as a slave via Ghostlink. It makes a nice external hard disk mirror system. ;^)

Oh, and Jason runs Mac wares on one of the 1040s - with Spectre GCR. Sure, it's not the very latest Mac, but it's not $2000 either.

Interesting. I thought the ST was just as easy to install a HD as the Mac is. Looks like this is not the case. To install a additional HD on the Mac, just install a SCSI cable in the SCSI connector on the Mac. Set the SCSI number in the control panel and bingo..it's so easy and anyone's gramdmother can do this. None of this boot HDUTIL.PRG nonsense.

> percent a year ago.

That sales info is a bit of an illusion. As you may or may not know,
Apple licensed its first clones almost two years ago. And PowerComputing,
the first clone maker, has had explosive growth over the past year. They
have been sucking away at Apple's market share with incredible power.
However, Apple still makes the OS (and a lot of the software) that runs on
the machines...so although their hardware market share has fallen, their
OS has not fallen as much.
I do not believe that Commodore or Atari had any company making clones.

> 1) Unit sales of Apple computers in the US market have dropped
> 21 percent, and in the world market, 16 percent - more of a drop in a
> single period than Commodore or Atari ever had. In fact, only Coleco
> comes to mind as a computer maker with a more severe sales drop.

First of all, many companies have taken 16% market share falls and
survived. Esp. after changing CEOs (as Apple has just done).

Also, Commodore and Atari sucked. They were slow, ugly systems, which
just didn't have any really good ideas behind them.
The Macintosh is the realization (although they have published a few huge
flops in recent years) of building a computer around the people that use
it. Instead of people having to change their way of doing things to use a

computer, the computer is made so it works with them.
Also, Commodore and Atari were snails compared to PCs. Power Computing (www.powercc.com) now makes a 225Mhz machine with a 604e RISC chip. It is far faster than anything you can buy in the WinTel market, no matter how much money you have. What's more, this is just the first wave of 604e chips, within a few months you will be seeing 250Mhz, and I'd be shocked if there aren't 300Mhz machines on the market before the end of '96.
And before '96 is over the 620 will be shipping, a 64-bit chip, while WinTel will still be stuck in 32-bit processor land.
And within the next 12 months, in addition to Pioneer, Radius, Power Computing, Daystar Digital, Acorn, Goldstar and Ing Olivetti, industry heavyweights such as IBM, Motorola and AT&T will be announcing that they will be shipping CHRP based Power Macintosh compatible systems, and who knows who else will sign up to make CHRP boxes?

> ---
> 2) Apple's home PCs are behind the times, and customers are

This is not really true, people's reluctance to buy Macs has a lot more to do with advertising than it does with the actual power of the machines.

> ---

Un-huh...

> Apple Computer - the denial ability of S&L managers, the financial
> security of junk bond funds, the technology of yesterday.
"technology of yesterday"

We can take a spiffy P5-200, with all the EDO ram and pipeline burst cache you care to put in it, it's happy EIDE drive (which over 90% of WinTel systems are shipped with...god knows why? Mac has been using SCSI for years, as all PCs should) and put it next to a put it next to a PowerComputing 225Mhz 604e and see which one looks more like the "technology of yesterday."

>FACT is, his
> precious Apple Computer is plunging down the toilet at a rate several

quinlan@sfu.ca barked in COMP.SYS.ATARI.ADVOCACY on 03 Aug 96:

>> At the highest level, a web browser is a document viewer.
>> Once you muddle with the document format, you no longer
>> have an open standard. You have a proprietary file format.
q>
q> But it isn't too bad if you freely publish the specifications for your
q> file format. I'm wondering, do you consider things like PCI and
q> OpenGL standards?

It /is/ too bad - the point of "standards" is that anyone can use them. When you depart from the standard, you are creating a proprietary format. Ever heard of Graphics Interchange Format? It is a standard (a copyrighted one, but never the less, accepted world-wide as a standard). GIFs can be viewed on damn near any machine that has a monitor attached, and some that use teletype output only. If you were to decide to add your own "extensions" to the GIF 89a definitions, then there would ge exactly /one/ person who could view your new picture format - you. Even if you publish the specifications for your extensions, if everyone else doesn't immediately adopt them (or worse, if the Standards Committee, in this case, CompuServe, who holds the copyright to GIF, rejects them), no one else will find them useful - in fact, they may be downright annoying if they happen to break existing GIF viewers.

To give you another example: Right now, you can buy an IDE drive from just about any manufacturer and it's pretty much plug & play (disregarding the idiocy if crippling SCSI in the first place, which is essentially what IDE is). BUT: How would you like it if you had to buy a new interface card and load new driver software to install a new hard drive? Or how would you like it if there were no CCITT modem standards, and your Brand X modem would only connect to other Brand X modems, while Jedi's Brand B would only connect to Brand B? That's what happens when you ignore standards.

PCI /is/ a standard interface. And the newest TOS computers incorporate PCI bus slots; there is also a (fairly expensive) VME-to-PCI bus bridge for older (e.g., MSTe and TT) TOS systems.

OpenGL is a Mac proprietary format, IIRC. Lord knows I don't use it at work.

>> Or perhaps, it is more like: It's fine if those people over there
>> are locked out, just as long as I'm not put out.
q>
q> I'm sure that I believe this at some level. But this is exactly my point,
q> PC and Mac users do not have to worry about being put out. I believe
q> that that was Peter's original point.

PC and Mac users certainly /do/ have to worry about it. Or they should worry, if they have any thinking capacity. Netscape has one "standard," MS Internet Explorer has another, Mosaic still another (and it's different from both of the foregoing), Lynx follows HTML 2.0 standards and breaks when it encounters Netscape or MSIE-specific codes, Chameleon has problems with them also... There is a plethora of propietary "extensions" to HTML out there. Anyone who wants to be able to view /all/ of them had better devote about 200 megs of hard drive space to assorted Web browsers.

Or he could just stick to the standard and ignore proprietary crap. that's not only easier, it's faster and cheaper.

Transaltion: "He, he, he. I can't read posts properly and I think I
see a chance to say buy a mac-AGAIN!".

>I thought the ST was just as easy to install a HD as the Mac is.
>Looks like this is not the case. To install a additional HD on the Mac, just
>install a SCSI cable in the SCSI connector on the Mac. Set the SCSI number in
>the control panel and bingo..it's so easy and anyone's gramdmother can do this.
>None of this boot HDUTIL.PRG nonsense.

Exactly the same thing on my ST and any other ST pete, if you looked
carefully at the posting it was actually a *FALCON* that the person was
talking about and it was not an additional HD but removal of the
normal IDE drive and using an External SCSI as the main drive. I don't
know to much about this side of the Mac and I expect it would cope
better but if you look at an equivalent situation with the internall
SCSI of a Mac being removed and attempting to boot from an external IDE
drive (with adapter of course) I would genuinely be interested to know
how it would cope.

>7200/75 is $999 which includes 4x CD, ethernet, 500 meg HD. How much for an
>equivelant Falcon would cost?

You are forgetting that an 8 meg PowerMac is inoperable - another 300 US$
for RAM. Plus MagiCMac and NVDI/Mac - woops - another 300 US$ gone. Plus a
Centronics cable - woops - 100 US$ gone, plus a monitor adaptor - woops -
50 US$, plus a Mac enhanced keyobard - woops - 200 US$ (note that Macs
generally ship w/o keyboard, exception: the Performa line), plus a
sensibly sized HD - 300 US$.

And if you somewhen need to change the internal clock battery - they'll
ask 400 US$ for that.

Um...what happened to those beloved FACTS of yours? What a fact filled rebuttal!

How about some more facts...

Like the fact that 80% of all computers used for color publishing jobs in the advertising, graphic design, printing, publishing and pre-press industries are Macintosh, according to a 1996 study by Griffin Dix Research Associates. At medium to large sites with more than five employees, the share of Macs installed jumps to over 85%.

Or

That GIGA Information states that Apple is the worldwide market leader in digital camera sales. The Apple QuickTake share is greater than that of all other digital camera manufacturers combined.

Or

Maybe that Apple has been named the number one vendor in customer satisfaction for the sixth time by Linea Edp, the major Italian MIS magazine.

Or

That Apple is the most used personal computer brand overall in Australia, per IDC, and is the number one brand in Australian small business, education, and consumer markets. And that Apple is the number one U.S. computer vendor and the number three vendor overall in Japan with 14% to 15% share per IDC and Dataquest.

Or

That Apple continues to lead the way in technological innovation. According to the 1/29/96 issue of Information Week, Apple Computer was awarded 53 U.S. software patents in 1995, more than any other vendor.

Or

Perhaps that the February 1996 issue of PC World magazine rated the Mac OS the best 32-bit operating system, over Windows 95, Windows NT, and IBM OS/2 Warp.

Or

That Mac OS was the clear winner in the Software Publishers Association's first "Ultimate Mac vs.Windows Challenge," in which users of each platform were asked to perform eight real world tests. The Mac user, a ten year old boy, finished his tasks significantly faster on average than his adult Windows counterpart (who I might add had another adult helping him!).

Or

That Apple Power Macintosh 7500 and 8500 received BYTE Magazine's 1995 Editors' Choice Awards of Excellence, which honor hardware or software products whose technical innovations set new standards for products in particular classes.

Or

That InfoWorld named Apple's OpenDoc the winner of the 1995 Landmark Technology Award, given to the most significant original idea or advance in a current technology each year.

Or

That Power Macintosh 8500 was named "Best Desktop System" in 1995 by Ziff Davis's United Kingdom PC Magazine.

I could go on...I could go on for a long, long, long time..but this is getting incredibly long as it is. Just because Bill Gates spent half a billion $ telling everyone that Win95 is the best things since DOS<sic> the fact remains that Win95 is like Mac85...BYTE said it best when they said:
"To see tomorrow's PC, look at today's Macintosh."

> >We can take a spiffy P5-200, with all the EDO ram and pipeline burst cache
> >you care to put in it, it's happy EIDE drive (which over 90% of WinTel

>
> Why not take a P6-200 with an UltraSCSI-Wide hard drive (something more
> appropriatem given the price range of your crappy 604e) and see which one >is
> behind then?...

Um...okay.
The 604e (which PowerComputing sells with UltraSCSI-Wide RAID arrays) will still crush the either the PentPro or the Cyrix 6x86...esp. if either of them is running Win95...give the PentPro WinNT...and it'll be closer...but not much.
And once the 620 and Copland come out it's just going to be sad. The performance gap is growing, it has been ever since Mac started using RISC... and it's only going to get bigger until at least '98 when Intel starts making RISC chips.

Look, I was born and raised on PC. I don't have anything against them, they have their uses...I guess...I just got fed up with spending days to install hard drives...fighting for hours to play games with my 16MB of RAM when the problem was that there wasn't enough under 640K!
I'm a consultant and I spend all day with both systems...and there's no question who gets their work done faster and who needs more help from me. I hope that Windows does stay powerful for a long time...it will keep my pockets full! But on my desk, you will always find the MacOS.

Be well

You are making references in past tense here...so I feel that I have
no recourse but to reply...you obviously don't know your history...
The Commodore Amiga and Atari ST both had many ground-breaking (oh yes!)
innovations when first introduced. The Amiga had the worlds first true
pre-emptive (not co-operative like Mac!) as well as the worlds first
first true 32-bit OS...Atari's had built in MIDI ports, DMA, fast GUI,
etc, etc,...both were leagues ahead of current offerings from other
manufacturers of the day.

>The Macintosh is the realization (although they have published a few huge

Okay, this is subjective and just my opinion; but I do not find Macs
to be more intuitive than my Falcon 030...I'm sorry but dragging the
floppy icon to the trash icon to eject the disk is not something that
strikes me as being "obvious"... :)

>Also, Commodore and Atari were snails compared to PCs. Power Computing

Again, you are using past tense here and if so, then you are dead wrong,
as the Amiga and ST blew smoke rings around PC cpu's of that time....

>And within the next 12 months, in addition to Pioneer, Radius, Power

Don't forget the Amiga! They are currently working on a new generation
of machines that will have the Amiga's tight, effecient, multitasking,
OS running on PPC's...Atari's TOS is already running on 68060's; I hope
to see TOS on the PPC, someday as well... Scary, isn't it? <grin>

As usual, you didn't quite "get" the message Mr. Sinclair...he was not
installing an additional drive at first, he was using an external drive
instead of the Falcons built-in internal IDE interface. JFYI, it is "SO"
easy to install a hard drive on an Atari...Yep, just cope baby... BTW,
you don't "boot" with HDUTIL.PRG...its used to configure and adjust the
parameters....please re-read the message carefully, its all there.. ! :)

I'm sorry for saying that they were slow. I didn't know about the top of
the line stuff. I've never seen the Atari GUI...and I have only seen the
Amiga GUI a few times. NeXT is a good system too...but they just don't
have enough of a software base, or name recognition to matter.

Sure...but the question is, why do well over 90% of PCs ship with EIDE? The average user isn't going to have a clue that there's a difference (I've run into other consultants that didn't know it mattered much). And you're going to have to install that SCSI card too...which you and I could do quick enough, but most people are going to have to hire someone to do that on their PC...with Mac it's right there, out of the box...it took me less than a minute to get my SyQuest EZ-135 out of the box and on my desktop.

And the bottom line is that Macs are not "technology of yesterday," even after you put that SCSI card into the PC it's still going to be much slower than a 604e...Hell, my 7100 (with a 601 at 100Mhz-- no where near as fast as the 604e at 100Mhz) runs rings around my friend's P-133...and it has a SCSI card.

Anyhow...

Yeah, and I can buy software for an ST where? Come to think of it...where
can I buy an ST?

> There were no facts to rebutt.
> One opinion was met with another.

There were no facts in my second post? Did you read my second post?
I don't know how many studies I sited.

I'll agree that I was totally out of line saying that Atari and Commodore
were slow. I was uninformed. However, it is a fact that a 604e 225Mhz
will run rings around anything with an Intel chip inside of it. And that
although Mac has lost market share recently that it is still one big
company, with a name known the world round, with a really high quality
product, has a lot of great ideas behind it, has millions of die hard
followers, and is going to make a new OS release that will change the face
of Macintosh as much as Win95 changed it for Windows...except, this time
it will be for the better.

(Let me also say that I would strongly support any other OSs that have
good GUI's and run on CHRP chips)

What is the different between Netscape and GIF89a? That makes Netscape
extensions propriety and GIF89a a standard? And PCI? And OpenGL?

I rather thought the point at hand was where or not Apple was doomed. I
could go on for a long time listing all the palces I know where to buy a
Mac from...I don't even have a clue where buy a ST...

And in very short order Apple will be (and has done) the same thing. Is
it too late? Maybe...

> : Also, Commodore and Atari sucked. They were slow, ugly systems, which
> : just didn't have any really good ideas behind them.
>
> Your humble opinion. Not mine.

Well, I have to admit that I was uninformed when I said that they sucked.
I had totally zoned on the fact that Commodore was responsible for Amiga
(which I liked quite a lot when you could still buy them in stores).
>
> : Also, Commodore and Atari were snails compared to PCs. Power Computing

Infact, the ST runs on the 68060 right now. Not a bad chip...but it's
still CISC. Also, there may be an Amiga OS for the CHRP platform.

> : It is far faster than anything you can buy in the WinTel market, no

>

> Personally, I'd rather get a bunch of Suns than spend that much money
> on a single chip. After all, it'd probably cost the same.

Ahem? I don't think so...Apples cost a little more but Suns
man...wow...those things are EXPENSIVE! There's a $9,000 Sun box sitting
in the OSU bookstore... it renders 3D images at less than half the speed
of my $2000 7500.
A 604e at 225Mhz is easily twice as fast as my 7500...and still costs far
less than $9,000.

> : And before '96 is over the 620 will be shipping, a 64-bit chip, while

Yes, DEC Alphas have been 64 bit for a long time...and they are so cheap
too...not. And that 64 bit mode isn't going to do you much good if you
can't access it...and besides there are many WinTel apps are still 16
bit...

Yes...so the question is: why are there so many WinTel machines still
running on EIDE?
>
> : and put it next to a put it next to a
> : PowerComputing 225Mhz 604e and see which one looks more like the

> like the technology of yesterday? Which is using the technology of
> yesterday? Which is better?

What kind of a compairison is this? Can I go down the street and buy one
of these? I think not. But this also brings up a good
point...mulitprocessing. Something that WinTel can't do very
well...within a few days Apple is releasing a dual Chip 604e...for around
$5000...as if one chip didn't totally outclass anything Intel makes...but
two...please.

> It's not about how big your d*ck is, it's about how you use it.

Another lead into a wonderful point. The fact that the MacOS is so much
easier to use (if you find a study that says otherwise...please send it my
way) than anything that Mr.Gates has put his name on. And don't even
start going on about SunOS's...

Apple has been releasing new technology after new technology for the past
two years (really longer than that, but the rate has been amazing over the
past two years). I've said it before, and I will say it again..."If you
want to see tomorrow's PC, just look at today's Macintosh" --BYTE

Because it's cheap. Same reason Chevy outsells Mercedes and Jaguar (the car,
not the game console <G>). For Joe Average, who has no ability to open the box
and plug things in himself, E/IDE is fine. For anyone with a screwdriver and
the ability to use it intelligently, it's pretty disgusting.

Hmm, I'll bet the last Atari you saw was an 8-bit system running plain-vanilla
Atari DOS (probably version 2.0). Hardly an up-to-date system even in 1985.

>Of course...I have to say that I'e never even seen a Falcon 030 in my

Here's a few starting points:

http://www.shareware.com (very limited but direct Atari search engine)
http://www.filez.com (much better)
http://www.3rdplanet.com/~starship/atari.htm (my Atari links - still limited but
growing)

>Do you know any place around Columbus, Ohio that I could see Atari's TOS?
>I'd really like to. How much are they going to cost?

I don't think you'll find a Medusa or Hades around there, but it's possible that
there's a Falcon user in town.

>I'm sorry to insult your beloved platforms without enough knowledge. I

Comparing an 8-bit system to a Mac is hardly fair. The C128 was the last Commie
8-bit. If you want to compare Commie to Mac, grab an old Amiga and stack it up
against the Mac Classic. Or for a more modern head-to-head, compare the latest
(and I don't mean "soon to be released," but something that's actually available
now) Mac system to the Medusa.

That unfortunately, can't be true...An Amiga (like the Atari 800XL
that was its predecessor before it) can only use 4 floppy disks. If
you say 4, then I'll believe it! <grin> If you haven't seen modern
Atari hardware (Falcon/Hades/MKX/DirecT 040+060) and latest software
offerings, then you've missed the best! Software and Hardware quality
for those who follow the Fuji has never been so good.

>Of course...I have to say that I'e never even seen a Falcon 030 in my

>where to start looking for it.

I have had my Falcon since 1993 and I've not been able to keep up with
all the software (commercial and especially PD) that is available. Its
very high quality also. I'm not saying that there is more than what is
available for PC's or Mac's but there is more than the average user can
keep up with. Try just about any of the major Atari FTP sites...they all
have sections dedicated just to the Falcon...

ftp to:

1) toad.net (umich mirror)
2) ftp.cnam.fr
3) ftp.uni-kl.de

and many, many others...not even mentioning GEnie and untold numbers of
WEB sites and privately run BBS's...

>I hope it does make a come back. I'd love to see them alive again on the
>CHRP platform. I'm in very strong support of any good GUI and any system
>that's main focus is on a high quality interface. Macintosh is just the
>only one I've found that people actually recognise...

Like Atari users, Amiga users are very dedicated and loyal...I believe
that the Amiga, as a whole, will do fine.

>Do you know any place around Columbus, Ohio that I could see Atari's TOS?
>I'd really like to. How much are they going to cost?

Hmm...not my area so I'm not sure...I think that there used to be a
pretty big user group in Miami, Ohio...(M.A.C.E.?) Perhaps someone
from Ohio can jump in here and offer assistance? :)

>I'm sorry to insult your beloved platforms without enough knowledge. I
>just have such strong memories of my Friend's Commodore 128...it was not
>so hot. And finding good software for it seemed like a real challenge.

In no way, shape, form or fashion can you compare the 128 to my Falcon!
They are of different worlds... <grin>

I was just randomly going through news groups when I saw the "Apple is doomed! blah blah blah" post and reacted...but this is really pretty neat.

I didn't know that there was actually an Atari GUI...I had heard that Amiga was still alive before I stopped by here...but I didn't know that they were thinking about running on CHRP...
Is there an FAQ for this group? Or could someone just fill me in on the state of things for Atari and Amiga in today's world?

Anyhow, thank you very much.

>they may be downright annoying if they happen to break existing GIF viewers.

So you are saying that a standard is made when a large group of developers
deside to support a particular standard? Well, 90+% of browser developers
support netscape extensions, so I guess that they are standard.

>PCI /is/ a standard interface. And the newest TOS computers incorporate PCI
>bus slots; there is also a (fairly expensive) VME-to-PCI bus bridge for older
>(e.g., MSTe and TT) TOS systems.

PCI is a bus architecture designed by Intel. It has widespread support but
it was created by Intel and is, largely, controlled by Intel. Just like
netscape extensions. What is the difference.

>OpenGL is a Mac proprietary format, IIRC. Lord knows I don't use it at work.

No. OpenGL is the graphics system used first by SGI and now by some PC
systems. Macs do not support OpenGL.

Please look at this posting as 'beginning good but getting a bit too carried away at the end'. RAAAAAAGE!

Brian Quinlan (quinlan@sfu.ca) wrote:
: Sure, the Web will probably contain mainly text until the end of time
: but that doesn't mean that other formats won't enhave it.

Actually, the web will always mostly contain 'information' of all kinds. The purpose of a web browser is to retrieve files from the Internet without the user having to worry about protocol specific stuff. The purpose of HTML is to have a uniform hypertext standard as well as giving a way of organizing the contents of the document. What is happening right now is that Netscape and Micro$oft are inserting a lot of non-standard tags to make things 'look better' and introducing close to WYSIWYG for HTML. I seem to recall that the original tags were made up in such a way that you were supposed to go 'Header level 1, I wish to look like this on my browser' - and you could get documents to look whatever they wanted to - on YOUR browser. Others would have their own configurations.
The problem that we now see on the web - whether you have noticed it or not - is that a lot of people are spending too much time on what things look like and forget about document context.
"Aren't you using Netscape? Get it NOW!" they say. Well, excuse me! My Internet connection is a terminal emulation through the Toronto Freenet. I'm using Lynx for crying out loud. And I _really_ wanted to know a little bit about Nashville, but the entire page is just [IMAGE] [IMAGE] [IMAGE] [IMAGE] [IMAGE]. I click on a random [IMAGE] and the next page looks just like the first one. Well, fine, if you don't want me to visit your home page, I won't. If you don't want my business, you won't have it. Goodbye.
It is amazing how web page authors want everyone to read their pages but forget that not everyone is using Netscape. So what was it you wanted me to get out of your page? Information or just some fancy text rendered with some nice art package? Try SELLING this... the worst thing is that that is exactly what they are doing...
"Well, sir, it looks damn great! How many will see this?"
"Oh, there are millions and millions of people on the internet..."
"Goodie! That's what I liked to hear! Thanks. Bye!" (customer leaves)
"...but only those using this specific non-standard browser will actually be able to see this the way it's supposed to be..."
There even was a site I visited that had a lot of [IMAGE]s, and on the bottom it said "Mail us!" - now, of course, I couldn't actually find their email address... I suppose it was in one of those [IMAGE]s...
Did you know that the Toronto Freenet alone has 30k users with text-only access to the Internet?

>the control panel and bingo..it's so easy and anyone's gramdmother can do this.
>None of this boot HDUTIL.PRG nonsense.

To install an HD on the Falcon:

SCSI:
1) Plug in drive.
2) If pre-formatted, boot and go.
3) If requires format, format using AHDI, then boot and go.

IDE:
1) Same story.

IDE on most Macs:
1) Um, there isn't any, it cannot be used.

If one sticks to AHDI, the process is easy. Moving to ICD can complicate
things, but we in the TOS market have a _CHOICE_, unlike most Mac users.
It's proprietary or bust for them.

quinlan@sfu.ca barked in COMP.SYS.ATARI.ADVOCACY on 04 Aug 96:

q> So you are saying that a standard is made when a large group of
q> developers deside to support a particular standard? Well, 90+0f browser
q> developers support netscape extensions, so I guess that they are
q> standard.

Excuse me? Netscape and CAB are the only two browsers that support all of
the Netscape extensions (less frames) to HTML 2.0; MicroSoft has their own
different and incompatible extensions, and Mosaic, Chameleon, Lynx, et al,
stick to the actual HTML 2.0 standard.

>> PCI /is/ a standard interface. And the newest TOS computers incorporate
>> PCI bus slots; there is also a (fairly expensive) VME-to-PCI bus bridge
>> for older (e.g., MSTe and TT) TOS systems.
q>
q> PCI is a bus architecture designed by Intel. It has widespread support
q> but it was created by Intel and is, largely, controlled by Intel. Just
q> like netscape extensions. What is the difference.

The difference is that Intel ran the standard through a committee process to
make sure that it wouldn't cause mopre problems than it solved. Intel also
manufactures more than half of the PC motherboards going into PCs today (the
number may be larger, but I could legitimately testify to "more than half"
under oath).

Netscape, OTOH, doesn't ask anyone else befoer they add more
Netscape-specific extensions to HTML, and doesn't supply "OEM browsers" to
other browser publishers.

>> OpenGL is a Mac proprietary format, IIRC. Lord knows I don't use it at
>> work.
q>
q> No. OpenGL is the graphics system used first by SGI and now by some PC
q> systems. Macs do not support OpenGL.

Ah. Well, then, it can't be an industry-wide standard, can it? It may
/become/ one eventually - but by accretion, rather than a standards committee
endorsement. Right now, it's a proprietary format, like Adobe's PDF.

...thus locking out anyone that doesn't support the PROPRIETARY
Netscape web document format. This nullifies the most useful
feature of the internet in general. System independence goes straight
to hell and one is left with 2 major alternatives. Implement the standard
correctly and get pooch screwed by any webmaster that thinks 'scape hacks
are the entire universe or attempt to emulate the monster yourself.

Thus, instead of Unix/Linux, one ends up with
PC-Ditto, Wine & WABI...

Furthermore %90 of webmasters don't implement most of the 'scape
non-proprietary standards (excluded) and those that do
do it so poorly as to make it less than useless.

Well, let's grab your machine, yank out it's internal SCSI drive and then
try to install an external IDE drive. Then we'll all watch how easily
your beloved mac boots up with this configuration.

>install a SCSI cable in the SCSI connector on the Mac. Set the SCSI number in
>the control panel and bingo..it's so easy and anyone's gramdmother can do this.
>None of this boot HDUTIL.PRG nonsense.

With the drive type for which it was designed, the Falcon would be
even easier than this. The user would just plug it in.

BTW- last time I checked Dirt Cheap Drives was selling 2.5 IDE's
213Meg for $80.

>Original Lemmings? Didn't Atari rely on Lemmings to continue the agony?
>Interesting.

I could do in 1987, what it would take PC's 6 more years to accomplish
at a price I was willing to spend. I had a machine that was before
it's time relative to PC's and spent a lot less for it.

This is not the profile of a lemming.

The profile of a lemming is a person who would flock to buy even then
obsolete clones just for the moniker of 'PC-compatible' when then
cheaper machines were capable of running any software those machines
would run that they might need.

Mac's (actually apples of any kind) were too absurdly priced to be
a viable option.

The price of a Mac still can't beat a well configured clone.

Tex will be stomped out by the likes of WordPerfect.

This may be the case but, it has not historically been the nature
of the net.

If webmasters decide to become sheep within the Mac and PC flocks,
then they'll destroy the greatest promise of the net.

All those VAXen that have been on the net since before clones existed
will get shut out. Petty Elitists will turn the net into yet another
enviroment where lack of excess wealth will be a barrier.

Not even all Mac and PC users will be able to access the fruits of
your philosophy. Those with the older 'ordained' machines will be
as locked out as any VAX or Amiga.

What makes this even more ironic is the fact that I have even heard
complaints about the nature of PC/Mac upgrade costs from the sorts
of people that already have more money than you'll ever see in your
lifetime.

Frills should remain such.

...and my point stands. You don't care if you lock everyone else out.

In the current political climate, it would be considered anti-
enviromental actually. The statement was posed within a certain
context. What do you have today that put that old machine on
the scrapheap in the landfill? Where have you moved forward?
Or do you just have a few more frills and a lot of stuff you never
use...

>suppose ST advocates think the world should sit still and end progress. No
>sir, I won't give up Quicktime 2.5 that does not exist on that other platform.

You don't use %90 of the functionality of quicktime. You probably don't
know what %90 of that functionality is. What you do use is probably
covered by the functionality of CyberStudio: available years ago for the
ST and usable in 512K of RAM.

>
>What is taking up an extra 7.5-15.5 megs? Are you reffering to HD space or
>internal memory? Considering a 64 meg equipped Powermac and Pentium is
>significantly cheaper than the 040 Hades and also have Netscape to boot up..

This might be germane if not for the fact that nearly no atari user
needs that kind of power. Our OS takes all of ~150K. We don't need
to spend money on Medusas or even Falcons.

The sort of people that use those would be the sort that would need
MUCH more expensive macs.

Once again, you are substituting a few marketing numbers for what
the machine can actually do for you...

...and the best you can come up with is a video display format.

I'd still love a copy of Klingon Kalamity and a .seq -> .avi converter
or the specs to do so.

BTW, the effective thruput of apple's own version of QT (2.03) is actually kinda crappy. Considering that M$ actually swipped QT code for MSVid, it's hard to imagine why it actually works better (faster).

The PC/Mac crowd has created a state wherein where everyone seems to think that in order to even drive one must have a Lexus and that an escort or even crown victoria would not do.

At least PC users have a civilized path in this regard with better incremental upgrades. Mac users are just plain screwed.

Digital Research implemented within the same space one needs
for DOS a GUI with a fully device independent API.

An ST running bitmaped text is faster than clone running dos
using text mode and a CPU that is twice faster and generation
advanced than the one in the ST. (more a tribute to motorola tho)

An ST runs software emulation of the below mentioned clone at
1/2. Given the nature of emulation overhead, this made it at
least 5 times faster than the more expensive machine below.

An ST was 1/3 the price of the cheapest contemporary clone not
even as powerful as the machine above.

There were no facts to rebutt.

One opinion was met with another.

You are a hypocrite and should have criticized the
original poster first.

For a knee jerk reaction its not bad really. It has a small resource
footprint and most of the necessities for a GUI. Admittedly it
doesn't have a lot of the frills or the bulk. Actually, I'd say it's
more of a poor man's X for DOS and CP/M.

It's similarities to System/Finder are primarily superficial.

>
>NetScape is many time more than cab.

CAB is meant to be an HTML 2.0 browser, not your one and only
one program for accessing every part of the net (including
text only streams).

Netscape, is also vastly larger.

The standard downloadable these days is 6M.

>Thats funny, i don't remember paying a penny for Netscape.

As a student, that's correct - you are entitled to unlimited use without payment. However, if you need technical support from Netscape, you have two options: (A) Pay for a fully-registered commercial release of Netscaep, which costs US$49 as of this very minute, or (B) pay the unregistered user tech support fee, which amounts to about $120/hour. I used to work there, I know what it costs. <G>

And, when you graduate or flunk out, you are in violation of US Copyright law if you continue to use Netscape without paying for it. Chances are no one will prosecute - but the fact is that, if you use Netscape beyond the permissible evaluation period, you are a thief and a criminal.

Have a nice day.

Actually, I have a comment to make about this: DVI files are actually processed TeX files (.tex), and they're not plain ASCII for a reason. They are meant to be typeset documents. ASCII is a very poor language for typesetting; TeX is one way around this. It's an extremely powerful typesetting language, and there's no possible way that anything even remotely similar could be done in ASCII.

: Great. But I could make the same argument about a word processor. How
: many users need to want multiple undo before I support it? Do it
: need to support it to be competitive. Well I guess that I'll
: wait until it's a standard.

That's different. HTML is a standard for the presentation of text.
You specify headers of different levels (), the emphasis of the
words (,,,,), the format of the text (
,
),
and various other things (,,
, etc.). (You know, I think I
really screwed up people who are using Netscape to read news) A word
processor is a method of entering text. You can have several word
processors, all of which work with a certain format (HTML is one of
those). The analogy is a poor one.

: > IMHO, the web is intended as a medium to transport text. There's lots
: >of tags to make the presentation better or easier, but the main purpose
: >is to transport text. Yes, forms and text entry fields can be useful,
: >but they should be used only when appropriately (as in search engines).

: Sure, the Web will probably contain mainly text until the end of time
: but that doesn't mean that other formats won't enhave it.

Proprietary exten$ions which degrade pages for those not using
particular browsers do more to hurt the Web then help it.

: > The same could be done with a short C program, and it would probably
: >work better, too. Java certainly has uses, but it's nothing close to
: >what the marketroids are making it out to be.

: The nice thing about Java applets is that they are very portable and
: are fairly secure.

C is very portable and more powerful. The security of Java also
depends greatly on what you let it do --- I've heard that you can write a
Java program to wipe your hard drive (don't ask me, I've just heard
this). When run in the proper environment, C is much more secure (i.e.,
under a Unix clone).

This is very true. I've heard stories of Amigas formating six floppy
disks at once...and I have to admit that an Uncle of mine had an Amiga
many years ago and he could do things on it that My father's PC couldn't
come close to...I totally forgot that Amiga was under Commodore...As for
Atari...well...I never saw one I liked.

Things that can a)be fixed with extentions right now, and b)will be fixed
in MacOS 8.0.
Of course...I have to say that I'e never even seen a Falcon 030 in my
life. They may be very good boxes (so are NeXT and the BeBox...) but
there's just not enough software for them...at least I would have no idea
where to start looking for it.

I hope it does make a come back. I'd love to see them alive again on the CHRP platform. I'm in very strong support of any good GUI and any system that's main focus is on a high quality interface. Macintosh is just the only one I've found that people actually recognise...

Do you know any place around Columbus, Ohio that I could see Atari's TOS? I'd really like to. How much are they going to cost?

I'm sorry to insult your beloved platforms without enough knowledge. I just have such strong memories of my Friend's Commodore 128...it was not so hot. And finding good software for it seemed like a real challenge.

GIF enhances interoperability and Netscape hinders it.

Ever try viewing a pixmap under lynx? I'd not bet on it being very
pretty on CAB either.

Then there are all of those 'best viewed with program X' and
download 'program X' bits littered about many web pages.

This phenomonon does not exist with GIF, or OpenGL, or PCI.

Furthermore, those are PROPRIETARY standards. Much like any other
PROPRIETARY standards, the proprietor could screw everyone else if they really
wanted too. Microsoft is notorious for this sort of thing.

The PixMap and Frames (which are ugly even on a weak PC running 'scape
itself) are classic examples of 'screwy' extensions.

The Atari ST, TT and Falcons use GEM (Graphics Environment Manager) from Digital Research Incorporated. GEM was ("is" IMHO) the most intuitive OS to be offered in the PC-IBM compatible market. It was nice that DRI cut a deal to port it to the Atari ST. So, PC'ers who have always been "cutting edge/in the know" types should already be very familiar with GEM or at least with the "office style" (desktop) interface. It is nice to think that at least some of the computing that people have done in the last 11 years or so was done so using elegant interfaces from DRI and not the weirdly worded Mac stuff or the old fashioned "tree directory" approach that MS forced people to accept with Windows. DRI did a poor job marketing their OS's, but they were the most amazingly easy to use the market has ever seen.

Atari clones will do OK in specialty markets and with computer hobbiest looking for an alternative to PC or Mac machines. It is pointless to argue the merits of a Mac over a Falcon. The average "computer" person will never even hear about a Falcon, etc. PC'ers really don't care as they have enough trouble figuring out how to keep their own machines up to speed. Mac users are in another world as far as terminology is concerned. Just my thoughts. I am too old to worry much about any of this. I don't even plan on making my kids computer literate. The real problems (like water and food) are much more important. :)

You want facts? I rarely have time for long posts in advocacy groups (I have more important things to do), but if you insist...

>How about some more facts...

Well, let's see...

>Like the fact that 80% of all computers used for color publishing jobs in
>the advertising, graphic design, printing, publishing and pre-press
>industries are Macintosh, according to a 1996 study by Griffin Dix
>Research Associates. At medium to large sites with more than five
>employees, the share of Macs installed jumps to over 85%.

So? And 90% or so of computer users use PC Compatibles. Does it make them the greatest thing since OS/360? Macs are nice for DTP and alike (but a lot of really high-end stuff is done on workstations, and some on NT boxes), but it definitely does not prove that they are the best.

>That GIGA Information states that Apple is the worldwide market leader in
>digital camera sales. The Apple QuickTake share is greater than that of
>all other digital camera manufacturers combined.

So? I have not really looked into digital cameras (don't need one), but from what I've seen, Apple's are not considered best by far.

>Maybe that Apple has been named the number one vendor in customer
>satisfaction for the sixth time by Linea Edp, the major Italian MIS
>magazine.

Well, for all I know it may mean that Italian computer manufacturers suck. Apple does not rate first in the US.

>That Apple is the most used personal computer brand overall in Australia, per
>IDC, and is the number one brand in Australian small business, education,
>and consumer markets. And that Apple is the number one U.S. computer
>vendor and the number three vendor overall in Japan with 14% to 15% share
>per IDC and Dataquest.

Which does not mean anything, because copmpetition in *MacOS* niche is fairly small (do Mac clone makers even sell in Australia?). How about Mac market share vs. PC market share in Oz? That would be far more meaningful comparison.

>That Apple continues to lead the way in technological innovation.
>According to the 1/29/96 issue of Information Week, Apple Computer was

>awarded 53 U.S. software patents in 1995, more than any other vendor.

Which, again, does not mean anything, as patents are given for all kinds of stuff wghich is not at all earth-shattering. How many of those patents were actually interesting, as opposed to "look and feel" and such?

>Perhaps that the February 1996 issue of PC World magazine rated the Mac OS
>the best 32-bit operating system, over Windows 95, Windows NT, and IBM
>OS/2 Warp.

I tend to disbelieve ratings in commercial magazines. In my personal experience, MacOS was so unstable, that while it might be fare to compare it with 5, putting it in the same league with NT is laughable.

>That Mac OS was the clear winner in the Software Publishers Association's
>first "Ultimate Mac vs.Windows Challenge," in which users of each platform
>were asked to perform eight real world tests. The Mac user, a ten year
>old boy, finished his tasks significantly faster on average than his adult
>Windows counterpart (who I might add had another adult helping him!).

Again, some bogus test with no background information. For all I know, fols who where using the PC might have been Mac users who hate Windows, and the kid might have been brainwashed to perform those tasks without thinking.

>That Apple Power Macintosh 7500 and 8500 received BYTE Magazine's 1995
>Editors' Choice Awards of Excellence, which honor hardware or software
>products whose technical innovations set new standards for products in
>particular classes.

Well, which other products did receive same awards (and, btw, who happened to be largest advertisers in BYTE in around that time?)?

I'd really like to know what was so new in those Macs? They did not seem to break any new ground.

>That InfoWorld named Apple's OpenDoc the winner of the 1995 Landmark
>Technology Award, given to the most significant original idea or advance
>in a current technology each year.

OpenDoc is neat, but does not really have much to do with Macs per se.

>That Power Macintosh 8500 was named "Best Desktop System" in 1995 by
>Ziff Davis's United Kingdom PC Magazine.

Again, what was the competition, what were the parameters, what was the category, etc.?

>I could go on...I could go on for a long, long, long time..but this is

boris-m@tensornet.com (Boris Molodyi) writes:

>OpenDoc is neat, but does not really have much to do with Macs per se.

It has a lot to do with the Macintosh in that it has, so far, only
been released for that platform.

>Uh, how much will such a system cost? In the same price range, why not compare
>Power Computing with an Alpha-based system, or a MIPS-based, system (either of
>which would eat it for lunch), or even a PPC-based system running a superior OS
>(say, NT)?

I priced a PowerComputing 225MHz system for $6000 (for a friend with money)
It has:
1MB L2 cache
225MHz 604e
8MB IMS 128-bit video card
2 SCSI-2 buses
4MB XClaim 64-bit video card
64MB RAM
8x CD-ROM
4GB AV Harddrive (7200rpm)
Keyboard
Mouse

That's not a bad price for such a stacked system. Most people would want
half the RAM, only one video card (that's not as good) and a 2GB non-AV
drive. Look at the web site for pricing for less robust systems.

>Hmm, have not seen the gap growing that much. In any event, Copland is not out
>yet, and neither is 620. OTOH, PPro and NT 4.0 are out and useable.

PPro does not compete well with the 604e so we don't have to hold our
breath for the 620.

>Why not take a P6-200 with an UltraSCSI-Wide hard drive (something more
>appropriatem given the price range of your crappy 604e) and see which one is
>behind then?...

Well, since you can buy the same PCI cards for both we should just compare
processors. Here are some ByteMarks:

Int Float
200-MHz 604e 4.3 4.4
200-MHz 603e 3.8 2.6
200-MHz Pentium Pro 2.8 3.5

Hmmm, and let's remember that that is for a 200MHz 604e with 512K L2 while
PowerComputing sells a 225MHz 604e with 1MB L2.

>deside to support a particular standard? Well, 90+% of browser developers
>support netscape extensions, so I guess that they are standard.

Absolutely untrue. 70% of browsers support MOST forms of Netscape
Extensions, which means that, by using them, roughly 1/3 of the Web
audeience is excluded.

>PCI is a bus architecture designed by Intel. It has widespread support but
>it was created by Intel and is, largely, controlled by Intel. Just like
>netscape extensions. What is the difference.

The difference is, one can successfully extend his system using VME, NuBUS,
or PCI. Many times, one cannot successfully web browse without "Netscape
extensions." Also, PCI bus is hardware, WWW extensions are software.

It's true that, when you look at niche markets, Apple seems healthy.
But look at the overall sales and financial picture, and things change
drastically, for the worse.

Remember, Atari was once an owner of over 85% of the MIDI and computer
music markets. It was one of the few markets they invested money in
to keep. Even now, after Atari Corp.'s demise, the TOS machine is going
strong in music. Did niche market numbers for Atari paint a rosy picture?
Yes. Was that picture financially realistic? I don't think I have to
answer that one.

Can't tell you much about the Amiga (although you could call Oregon Research and see what they're selling - I know they were supposed to release a /commercial/ web browser last month); but if you take a look at http://www.3rdplanet.com/~starship/atari.htm, you can get all sorts of references. The Network ST home page even has a screen shot of a full-screen GEM window running on a Falcon.

The GIF standard is copyright CIS - and CIS made the "changes" which turned GIF87b into GIF89a. The Netscape extensions are proprietary; they aren't even copyright anyone in particular, much less accepted by a standards committee anywhere.

C is not very portable when you need to use any form of interaction besides
stdio. Tell you what, write a C program that displays a window prompting
the user to enter a number and then shows the square of that number in
a window. Easy right, now make sure that it runs properly on SGI, Sun, HP,
Macintosh and PC (under linux, OS/2 and Windows). Not so easy, is it?

Try X. X runs on SGIs, Suns, HPs, Macs (under mkLinux), PCs (under
Linux), and a bunch of other systems. You write *one* X app, and
recompile it under each platform (due to the differing processors), and
it'll work.

I wonder why this is? Could it be: no standardization?

What you are advocating is precisely what you descibe below.
Instead of a cross platform API, you want us subjected to 3 or
more forms of MFC, toolbox and whatever OS/2 uses.

The SGI, Sun, HP, and linux boxes however will be no problem to
write in a cross compatible fashion.

STonX is an example of this.

Thanks to that vile X Consortium...

According to Netscape, Navigator represents 80% of the browser market.
The source isn't that great but the number seems reasonable. Internet
Explorer probably represents at least 10% of the broswer market
and it supports netscape extensions.

>The difference is, one can successfully extend his system using VME, NuBUS,
>or PCI. Many times, one cannot successfully web browse without "Netscape

Well good. If it's actually better than Mac, then I hope it finds its way
to my desktop...still, I doubt that finding software for it is anywhere as
easy as it is to find for my 7500...maybe that will change, and if it's
better, so will I.

Hey, I just responded to a post that was already up there, and in my
orginal post, there were many points about Atari and Amiga...now I'm just
making sure that everyone understand that there are facts behind my
words. If I must stop, I will.

Well...it kind of does...see, a Lexus is better than a Ford...but there
are a hell of a lot more Fords...and I don't think Lexus is going out of
businesses any time soon...

No, not best at all...you can buy lots better ones (starting at about
twice as much for about %10 more "betterness"). The point is that they
have stong markets.

>

Believe it or not, Italians buy computers made all over the world...and
are open to the same market that the us and other companies are...it says
nothing more than that Italians have taste.

>

Dude...that is. It's talking about ALL computers...the term "personal
computer" (found above) includes PCs as well. Those numbers include every
single PC maker that ship internationally (which is just about all of
them). Just like the Italian numbers.

A vast hord! With INCREDIBLY useful technologies like OpenDoc, QuickDraw
GX, QuickTime 2.0, QuickDraw 3D, their digital camera technologies,
QuickTime VR, their BEAUTIFUL case desinge on the 7200, 7500, and
7600...their new PowerPC motherboards, the DIMM 128K data path on
them...and tons, tons more.

The many different PC adds add up to many times more what Apple was giving them.
>
> I'd really like to know what was so new in those Macs? They did not seem to
> break any new ground.

Go buy one! Jesus! They are the incredible! They brought DIMMs, great
built in video capture, daughter cards, PCI compatability to the MacOS,
DAVs, and zillions of new software featrues...like the above mentioned
QuickDraw GX and 3D...incredible thigns.

>
> >That InfoWorld named Apple's OpenDoc the winner of the 1995 Landmark

many OS's
> can you run on a Mac?

Well...um...well, with a PCI DOS card you can run anything you could run
on that PC (plus MacOS)...with SoftWindows right now (w/o and hardware
modifications at all) I can run DOS,Windows 3.1(1), and Win95...
And come the end of '96 when MANY (there's a list in one of my eariler
posts) companies start making CHRP (common hardware referene platform)
boxes you will be able to run what ever you please on them...MacOS, Lynux
(sp?), DOS, OS/2, and even Win95.<g>

> >Um...okay.

NT...superior OS...that's beyond laughable.
And Alpha systems cost WAY, WAY more.
As do any UNIX boxes.
>
> >And once the 620 and Copland come out it's just going to be sad. The

> Hmm, have not seen the gap growing that much. In any event, Copland is not out
> yet, and neither is 620. OTOH, PPro and NT 4.0 are out and useable.

First of all, my 100Mhz 601 (which is WAY, WAY slower than a 604e)
absoultly crushes my friends P5-133...and that's a compairison between
Descent running on my box and it running on his, through DOS...in Window's
based tasks the difference is even sadder.

Why would I need to spend $300 for ram? 16 megs go for $120. Why would I need a Centronics cable? $100 for one is absurb. Why would I need a monitor adaptor that costs $50 when Sony and Viewsonic bundles one? Why would I need to spend $200 for a keyboard when one can be had for less than $50? 500 meg HD is sufficient for most people but to include a extra one can be had for less than $200 for 2 GIGS. Must be expensive on your side of the Atlantic to support the welfare state.

>
> And if you somewhen need to change the internal clock battery - they'll

ROFT.. You mean they charge that absurb amount to change a clock battery? Must be double for the Falcon..

> answer that one.
> ---

He he he. The Midi market was never huged when Atari supposely owned the
market. Atari had a lousy mix of products to begin with. What killed Atari
was their inability to serve that market such as upgrading thier line in a
timely fashion and in enough quantity. Atari took the midi market for granted
and did not really do a credible job of supporting it.

Apple is currently in many niches and doing quite well. Another independent
study was recently released that Apple will increase thier share of the K-12
market.

August,
You obviously had little trouble finding support for Atari systems.
After all, you're here! All you'd have to do is post in
any Atari support group, tell people what you need to do, and, in
most cases, people will tell you what software to get and where.
It really isn't that hard to find support. You could also
do a search on the WWW for Atari pages. www.toad.net is a very
good place to start. It is true that you have to deal with
mail order for Atari software but it is only a minor nuisance.
You can also download top quality software from an ftp site near you.
-scott tirrell
The Falcon is an incredible machine. You might want to download
the MagicMac demo to get an idea of the Atari desktop.

-snip-
Regarding IDE drives
this has been my experience :^(
I had a WD Caviar, I purchased an IBM
they would not work together, as master/slave, slave/master, whatever.
As _individual_ drives attached one at a time to my IDE controller card they
would work fine, but NOT together.
Next I tried a Seagate IDE, would not work with IBM or WD, only seperately.
next I tried a new IDE card, drives would still not work together.
then a friend loaned my an IDE card, still won't work
Might be my BIOS?
who knows. who cares at this point? I've been spoiled by the Atari.
I just buy any old SCSI drive, plug it in, it works
2 simple.
I _do not_ believe that IDE drives can work together.
theoretically maybe, and there are probably people out there for whom
this works.
me - I'll stick with SCSI :^)

>can you run on a Mac?

Mostly good points but the Mac is about the best platrorm if you want
to be able to use multiple OSs with a good turn of speed. You can hae
MacOS, MagicMac (TOS/Atari), Windows 3.1, DOS, Windows 95, Linux and a few
other minority systems, you also have the PC compatability cards wich
give you real PC power allowing you to truely have 2 machines in one.

>share of the IBM compatible market.

Not Correct! There are many Atari clones like the Hades & Medusa and
C-Lab now makes the Falcon and upgraded Falcons so I guess uou could
call them clones. IBM don't actually control a pathetic share it's
about 8.8 percent, I say thats quite good considering the huge number
of machines out there especially as they paid all the R&D costs and
had to compete with people that just copied it.

>: And before '96 is over the 620 will be shipping, a 64-bit chip, while

>like the technology of yesterday? Which is using the technology of
>yesterday? Which is better?

Compare a machine using the same number of the 604's as Intels machine
uses Pentiums and the Intel machine looks like the technology is the
technology of yesterday (and more expensive too), the technology of
yesterday is the Pentiom and the 604 machine is better. I don't see
your point.

OK, so running your program will force me to have a complete X implementation for my platform. I would assume that I'll also need a C compiler and I'll need a complete unix implementation if the X program needs to do fancy stuff like access the network or even check the time. Good idea, I'd much rather install all of that crap than install Sun's 2MB applet viewer.

: >it'll work.

: OK, so running your program will force me to have a complete X implementation
: for my platform.

Yep. That way, I have the same environment on each. With the same
environment, I can run the same program. Your idea says, "Let's write
the code three times over for completely different and incompatible
environments, then use #ifdefs to mark off large portions of the code."
That's just stupid.

Anything is incompatible between environments unless you change large
amounts of the source code. If one environment can emulate another
(MS-DOS emu, WINE, MS-DOS boxes, SoftWindows), then it's easily possible
because it's the same environment.

The difference between how C is compatible and how environments are
incompatible is that C does not rely on hardware dependant mechanisms
(unless you put in assembler or write straight to the hardware (in which
case you are being directly dependant on the hardware, no matter how
portable C is)). If you write good C code, it can be ported between
Suns, HPs, IBM mainframes, PCs, Macs, Crays, Vaxen, and maybe even
PDP-10s! If you have the same kernel running on each, same C compiler,
and same set of C header files, then all it takes is a re-compile. With
different kernels, compilers, and headers, you have utilities like Imake
and autoconf which allow you to create Makefiles to turn on or off
specific workarounds in your code.

: I would assume that I'll also need a C compiler

If you don't want to compile it, get a binary for your platform.

: and I'll need a complete unix implementation

No, you will simply need the X server (having configuration files and a
window manager helps, though.) BTW, my X server (XF86_SVGA) is 1433k,
and it supports nearly any video card you can think of. That,
configuration files (15k), and a window manager (fvwm 2.0.43 (146k)),
comes to 1594k, just over one and a half meg. Much smaller than Windoze
(any recent version), and pretty good overall.

: if the X program needs to do fancy stuff like access the network or
: even check the time.

Give me a break. If the facility to access the network is there, you
can access it. Ditto with checking the time.

: Good idea, I'd much rather
: install all of that crap than install Sun's 2MB applet viewer.

I think you would. It's smaller and more useful.

Overpriced purchase? Say again...Who still charges $1500 for an 030 box today
that the market already has put out to pasture? Interesting. I see what you
mean. I consider the $999 7200/75 a bit overpriced despite the included 4x CD,
two ethernet ports, 16 bit sound and acelerated video. Yep the Powermacs are
overpriced. Thank god for PowerComputing and soon Umax/SuperMac.

It seems with the rest of the market falling down upon them and
the general public believing in the imminent demise of Apple, that they
need to beat on what they percieve as an easy target.

The ST is history now (for the most part). It is odd that anyone
who would bother to come into this group would not have the slightest
hint of it's existence.

This example intrigues me, for I view the value of a Lexus to be
in pretense only. I suspect that Mac's serve the same function for
these advocates.

I get more utility out of an F-150 than I could ever get out of a
Lexus for it is actually designed with the above average american
male height in mind.

I wonder if they hit the ceilings of their Macs with their heads?

No, the standard should be constructed such that non-support for
GIF is not a problem.

This is, in fact, the case.

Properly coded pages will have Text Only display options for
the Images.

>Why would I need to spend $300 for ram? 16 megs go for $120. Why would I need

It's still an added expense however. Unlike the common Apple paradigm,
the machine is not ready 'out of the box'. It needs modification to
be usable.

>a Centronics cable? $100 for one is absurb. Why would I need a monitor
>adaptor that costs $50 when Sony and Viewsonic bundles one? Why would I need

Then you'll be paying the premium likely to be stamped on anything
'Macintosh'.

>to spend $200 for a keyboard when one can be had for less than $50? 500 meg HD
>is sufficient for most people but to include a extra one can be had for less

This is a rather lame excuse for being behind the times...
Mac's have always been behind in bundled storage and RAM.

>than $200 for 2 GIGS. Must be expensive on your side of the Atlantic to
>support the welfare state.

So? Who sells SCSI drives that cheap?
Dirt Cheap Drives doesn't count...

>
>OK, then please explain the difference between OpenGL and Java?

Why? It's been pretty well proven that HTML does not equal Java or
Shcokwave. The WWW is an HTML-based information transfer network. Neither
Java nor Shockwave reside on the web, they are simply methods of sending
data. The most basic, most compatible, most correct way is to send it
as HTML 2.0 information.

Even sending graphics, when those graphics are _REQUIRED_ to access the site,
is incorrect. A site that requires graphics eats bandwidth and eliminates
the ability of Lynx users to use the web.

If, for example, I had NO ASCII text at all, but instead, rendered the site
(say, an online version of War and Peace) as a set of PCX files, would that
be proper? PCX is an accepted, universal format for bitmapped graphics. But
would bandwidth-hogging graphics be necessary, just so one could display
fancy flourishes in letters?

There's a time and place for everything. Using Java is not inherently wrong -
but making a site unaccessable to an HTML-compliant browser most certainly
is.

>people who govern those standards.

Well, in a manner of speaking, yes. Sun owns Java, and any app
that claims to run Java or Java script has to meet their
approval. Same is true of Macromedia/Shockwave. However, since
both of them are being used in non-standard ways (e.g., over the
Web via HTML), they are, in fact, simply downloadable files (or
the scripts that produce the desired effects are), selected and
transferred via HTML but not part of the HTML standard. That's
why I suggested the IGS page (which I /do/ intend to put up Real
Soon Now); it's the exact same phonomenon; people who don't have
the necessary hardware /and/ software to run the
/application-specific/ files will just get a lot of (to them)
useless text. People who are running the Atari ST will get
full-motion animation and "chip" sound with very little overhead.

That doesn't make IGS a standard, though. It's still a
specialized application, as is Java/Javascript and Shockwave.

As you can see, EVERY post by him is in an Atari newsgroup - even
the one in the video games hierarchy.

Well, since the man (I use the term loosely) hates Atari so much,
he obviously must be a complete bonehead to hang out in the Atari
newsgroups. Thus a new newsgroup is launched in his "honor:"

alt.bonehead.sinclap

Oh, and Petey: Just because your news server doesn't carry it
doesn't mean that hundreds of thousands of people all over the
world can't. Maybe you can get your sysadmin to explain the
difference between "auto-add" and manual addition of new groups.

This idiot must be doing keyword searches on newsgroups for anything negative said about Macs. Mac Lusers are an insecure bunch of fools that have to constantly defend their overpriced machines. With a declining world market share of 10% and US market share of 7%, I guess they will be getting downright meaner.

Let's make it clear: Apple lost the desktop wars. OK. Feel better? There is nothing that Apple can do to win marketshare. They had the world in their hands, but frittered it away due to piss-poor management by a French dude and a sugar water dude.

It settles who's used the better compiler. Cross-platform tests
that use simple benchmark numbers that test nothing but math are
meaningless. What can the system do in the REAL world? How long
does it take to move 50 megs of data from one address in RAM to
another address in RAM? Of course, even there, you're testing
overall system design, not just the CPU, but that's a lot closer
comparison that tesing a math program.

Given a choice, I use SCSI also, but IDE is the "standard" for
people who have to pay technicians to install things. <G>

WD, Quantum, IBM, and I think Maxtor have difficulties working
together in an IDE master/slave chain; certain drives abosultely
INSIST on being the master in such a relationship when working
with a different brand of IDE drive. And IDE is, after all, an
IBM-designed and somewhat-crippled version of SCSI. The name of
the designer, and the fact that it has departed from the SCSI
/standard/ should tell you why it has problems.

Is that funny where you come from? You said you installed a CD Rom
changer in less that a minute and the other bloke said all you ahd to
do was plug the cable into the Falcon to attatch a Hard Drive. That
was funny, once again you seem to have completely mis-read a posting.

Oh, please...Like the Atari Falcon was useful out of the box. The 7200/75 came
out in July/95 and since has been discontinued. With Ram Doubler 2 for $50
will tripple the memory.

>
>>a Centronics cable? $100 for one is absurb. Why would I need a monitor

Actually, Ron, the 800 series can access 8 floppy drives. Atari
didn't produce any drives that would set to D5: or higher, but
there are after-market ROMs for Atari drives that do that. And,
if you install a RAMdisk in, say, a 130XE, you'll find that you
can assign drive numbers up to 8 (possibly higher, depending on
the RAMdisk software).

>Dude...that is. It's talking about ALL computers...the term
>"personal computer" (found above) includes PCs as well.

Ah, but the key word is "brand." There are exactly one /brand/
of Apple computer. There are /thousands/ of brands of other
personal computers, including but not by any means limited to
IBM, Compaq, Dell, Putrid Smell, Panasonic, Joe's Garage, ad
nauseum. Thus, in order to be the number one /brand/, Apple need
only outsell the largest PC market share holder. Since, until
recently, there /was/ no competition for MacSystem boxes (unless
you count emulators, and you shouldn't), Apple has an effective
monopoly on the market in Oz.

: NT...superior OS...that's beyond laughable.

Yup. :)

: And Alpha systems cost WAY, WAY more.

Depends on the configuration of the Alpha and the PPC.

: As do any UNIX boxes.

Linux is free. GNU software is free. X is free. You can set up a
fully functional Unix box with a GUI for free, as long as you have the
hardware to do so.

It depends on what you want to use it for. If you want an
all-in-one system (less monitor, of course) that has built-in
MIDI support (including BIOS support for MIDI), there /is/ no
other system. Each system has its own strengths and weaknesses.
The Mac file system is a weakness, but the relative abundance of
commercial software is a strength (if you prefer the commercial
wares; personally I prefer shareware). Finding software for the
Atari is admittedly harder than for a Mac. It's almost always
worth the trouble, however, unlike more popular platforms, where
it's quite common to find 10 crappy wanna-be programs for every
"this is /almost/ good" program, and hundreds of POCs ("Pieces of
Crap") for every truly good pacakge.

As I have said before - how many videotape databases does one man
need, anyhow?

>> >Do you know any place around Columbus, Ohio that I could see

>Know where I could start looking...I really want to see one now.

Not offhand, but post a question in comp.sys.atari.st and you
should at least get an intelligent reply, even if it isn't "yes,
I have one you can come see."

>Anyhow...I want to learn more about Atari.
>But I'm still happy with the Mac on my desk.

For many purposes - even for most purposes - the Mac is a fine machine. I hope to add one to my "stable" someday. I won't give up my Atari, but I would like to have a Mac as well.

>Thank you for the education.

Intelligent discourse is always a pleasure.

: > Correct. Java and Shockwave are standards. They are not part of the
: >HTML standard, however.

: OK. So HTML is the only standard that should form the basis of the WWW?

Yup.

: There is no content format, besides text, that is part of the HTML
: standard.

Correct.

: So GIF needn't be supported and therefore shouldn't be used?

No, it does not have to be supported. From section 5.10 of the HTML
2.0 draft standard (IMG), under SRC:

SRC
specifies the URI of the image resource.

NOTE - In practice, the media types of image
resources are limited to a few raster graphic
formats: typically `image/gif', `image/jpeg'. In
particular, `text/html' resources are not
intended to be used as image resources.

It does not specify that GIFs or JPGs must be supported, and so it's
not required. Those two should be used if you are creating an image to be
displayed on the Web, however; the standard, in stating that the typical
formats for images are GIFs and JPGs is reinforcing the use of GIFs and
JPGs as image formats to be used on the Web and supported by graphical
browsers.

Well, but what does it say about qualities of MacOS? Nothing...

>Believe it or not, Italians buy computers made all over the world...and
>are open to the same market that the us and other companies are...it says
>nothing more than that Italians have taste.

I believe that. But again, satisfaction rate does not mean much. There are lots of people satisfied with their FOrd Escorts and Honda Civics, but Lexus still is a better car B^)

>Dude...that is. It's talking about ALL computers...the term "personal
>computer" (found above) includes PCs as well. Those numbers include every
>single PC maker that ship internationally (which is just about all of
>them). Just like the Italian numbers.

OK, it still isn't. Assume that Apple has even an incredibly high market share of 15% (it probably does not). It still means that 85% market share belongs to various PC clones.

>A vast hord! With INCREDIBLY useful technologies like OpenDoc, QuickDraw
>GX, QuickTime 2.0, QuickDraw 3D, their digital camera technologies,
>QuickTime VR, their BEAUTIFUL case desinge on the 7200, 7500, and
>7600...their new PowerPC motherboards, the DIMM 128K data path on
>them...and tons, tons more.

Hold it, hold it...

It is all nice and well, but let's see... DIMMs (and better memory schemes) were known to man long before Apple introduced them. And by the way, they only have 128 bit data paths, not 128K (that would be cool, though). Higher data paths were used before.

New PowerPC motherboards... Yeah, so? People come out with new Alpha, Intel, MIPS, SPARC, etc motherboards all the time. What makes Apple's so unique?

Beautiful case designs?! Beauty is in the eye of the beholder, innit? 7xxx series aren't ugly, but it 1. does not say anything about what's inside, and 2. there are tons of equally cute machines out there.

QuickTime VR. Yeah, nice, but so what? I much prefer actual reality.

QuickTime 2.0. Yeah, but what is so revolutionary that it can't be done on other systems? As all QT, it's bloated and rather ineficient.

QuickDraw 3D. Yawn. I was running system with OpenGL for years, and it was available even before that.

QuickDraw GX is nice, but how many people really need it's advanced typographical capabilities? Most of it can be done with Unicode just as well, too, and Unicode has been around for quite a while.

OpenDoc, again, isn't anything earth-shattering. There was a lot of talk about things like it a few years ago, and OpenDoc is just one of many projects that managed to survive until now.

>The people say what the people say...you can say what you want to say...
>I've worked with plenty of Win95 machines that couldn't run for more than
>half an hour before they would crash...

Win95 isn't stable, I agree with that. Half-digested DOS code and all. In my experience, though, MacOS was significantly less stable than NT, or even TOS.

>Well...you can read all about it at Apple's web page...it was highly ammusing...
>The details only make it that much more painful...the kid was infact,
>randomly picked out of the croud watching them...

Ahem, got an impartial Web page for it?

>built in video capture, daughter cards, PCI compatability to the MacOS,
>DAVs, and zillions of new software featrues...like the above mentioned
>QuickDraw GX and 3D...incredible thigns.

Well, they might have brough it to MacOS, but the "other" platform had PCI, daughter cards, video capture, DIMMS, EDO RAM, OpenGL, Unicode, etc., etc. long ago. What's so incredible? That Apple finally caught up?

>Well...seeing as how the MacOS is the only OS that runs it...yeah.

It's supposed to be an open standard running on all major operating systems, isn't it? If Apple won't do that, OpenDoc will be about as useful (and open) as a spoiled can of spam.

>Well...um...well, with a PCI DOS card you can run anything you could run
>on that PC (plus MacOS)...with SoftWindows right now (w/o and hardware
>modifications at all) I can run DOS,Windows 3.1(1), and Win95...

>posts) companies start making CHRP (common hardware referene platform)
>boxes you will be able to run what ever you please on them...MacOS, Lynux
>(sp?), DOS, OS/2, and even Win95.<g>

Yeah, sure, so I can plug in an overpriced card with 486 on it and run Windows programs. How exciting... SoftWindows is emulation. We could do it on Atari 10 years ago (PC-Ditto).

By the way, when CHRP comes out... it will run NT, MacOS, most probably Linux. It will have to run DOS in emulation, as no one is going to port it. And as far as I know, OS/2 for PPC was scrapped, so it will have to run in emulation as well...

>NT...superior OS...that's beyond laughable.

Well, _I_ like it better. Much more powerful and stable that MacOS will be, and offering real multitasking, security and stability now, not in 5th upgrade to Copland.

>And Alpha systems cost WAY, WAY more.
>As do any UNIX boxes.

Unix boxes are expensive (unless you run Unix on x86), but Alpha systems are quite comparable in price, and given Alpha's speed advantage, they have better price/performance ratio.

>First of all, my 100Mhz 601 (which is WAY, WAY slower than a 604e)
>absoultly crushes my friends P5-133...and that's a compairison between
>Descent running on my box and it running on his, through DOS...in Window's
>based tasks the difference is even sadder.

Well, I've never compared Descent. We have, or had, at various times, 3 Macs, 2 Ataris (ST and TT), one NT box with 90MHz Pentium, and one W95 box with P133. Mac has 601 accelerated to 82MHz (it was 6100/60 originally) with 256K external cache. NT box outruns it, in real world applications _I_ use by a factor of about 2 at least. Surprisingly enough, W95 isn't much faster. (It'l become NT 4.0 as soon as it ships). PPC by itself is an OK chip. However, with MacOS on top of it, it's quite a dog...

Ram Doubler is a "virtual memory" package. It has been alleged
by people I trust that it does NOTHING that your system software
wasn't already doing. In other words, you pay extra for a
product that does nothing - snake oil.

And, by the way, "tripple" is not an English word.

Jabba said:

>Say what? What premium is that? At work, we recently purchased
>some HP Laser Jets. No extras needed. Just plugged in the
>cable to the Apple Talk port. No mess nor fuss.

According to Hewlett-Packard's pre-sales info line
(800-752-0900), the AppleTalk port (which is actually a LocalTalk
port, according to HP - apparently you don't even know the
correct terminology for your chosen religion) is an /extra-cost/
option on the LJ4 and 5. That's a premium. The LJ4M and 5M
include the LocalTalk port, but the "M" models cost more than the
"plain" models. Therefore, it's a premium.

Put up or shut up, Petey.

I never said Lexus was a very good car. In fact, I said it was a poor
one.

The Mac/PC crowd has convinced the general public that one needs
a Lexus just for basic transportation and that an escort or
even a crown victoria will no longer do...

>
>Oh, please...Like the Atari Falcon was useful out of the box. The 7200/75 came

Yes it was actually. Even without a harddrive, any ST+ class machine
is quite ready to run with even 1Meg RAM. This is the benefit of
an OS that takes 200K of storage and 200K of RAM.

>out in July/95 and since has been discontinued. With Ram Doubler 2 for $50

>> 'Macintosh'.
>
>Say what? What premium is that? At work, we recently purchased some HP Laser

I've seen complaints in mac.advocacy regarding the way in which mac
vendors soak mac users for components such as monitors and harddrives.
They'll do nothing more than slap a 'for mac' sticker on a generic
part and jack up the price.

>Jets. No extras needed. Just plugged in the cable to the Apple Talk port. No
>mess nor fuss.
>>
>>>to spend $200 for a keyboard when one can be had for less than $50? 500 meg HD

Peter, you even argued in C.S.MAC.advocacy that this box was insufficient
for entry level, and that Mac was still too expensive.

Fact is, dollar for dollar, capability for capability, it's still easier to
get into computing on the TOS platform (and cheaper) than it is on entry-
level Mac. Period.

Actually, acording to Byte, they used MrC. MrC is a very commonly used
PowerMac compiler (maybe 30% of the market, just a guess). They could
have used xlc which probably would have produced better results. On
the other hand, they did use Intel's compiler for the PentiumPro.
And remember, a test of math functions should favor the PentiumPro because
it has some trancendentals implemented in hardware. BTW, the PPC is
heavily optimized for memory moving.

OK, Peter, you seem to know everything (a common situation for
undergrads, as I recall).

Please, O Fount of All Knowledge, tell us what was necessary to
add to a Falcon to make it useful? And don't waffle on about
monitors, the Falcon is available with your choice, or no
monitor, as the customer desires. Talk about the computer. Or
admit that you know not whereof you speak.

So it was $2000 more. That's 1/3 more which is not "close". Did it have a
128-bit 8MB video card and a 64-bit 4MB video card? Did it have a 8x CD-ROM?
Did it have 64MB of RAM?

So can a Mac SE and LC class machine in thier standard memory configuration
when using System 6 and System 7.1. Nothing efficient about the Atari OS
considering it still 1980's based.

The 7200/75 can run fine with 8 megs of memory when using low memory apps such
as ClarisWorks, WriteNow, Nisus which have no equals in the ST platform.
Considering the price is $999 which includes 4x CD and two ethernet ports which
are expensive extras on the $999 Falcon.

I can use any monitor that pe cee users can with out the extra cost. Please
specify an instance from a mac Jihad?

I still do. But compared to the Falcon, a bargain. Apple's Macs are expensive
compared to PowerComputings offerings. If I were to buy a Powermac today,
would be the Powerbase 180.

> Fact is, dollar for dollar, capability for capability, it's still easier to

You are full of shit! You can get new Cyrix 586 boxes with 16 megs, 1.6 gigs,
4x - 8x CD with monitor for $600.. New Mac 638's with CD, tv tuner and 15'
monitor with software bundle for less than a $1000... I have seen Mac II's for
as little as $99.

Apple Talk is Local Talk. What part do you not understand? You're behavior of being ass has followed you from alt.sex.fat!

I don't know what HP stated, but we did not pay extra. Also the HP's came with ethernet ports as well.

Yes.

<<Kosh mode off>>

Somehow you omitted the fact that the qyuoted price was on 300MHz Alpha (rather expensive at the time). Now, several month later, and if we drop to MHz rating comparable with your Mac clone, it will be the same price if not lower.

It had one video card (but with dual monitor support, I believe), 64MB of RAM, and the works...
The above does not necessarily represent views of my employer,
my educational institution, or of myself.

: Actually, acording to Byte, they used MrC.

Use something generic, like GCC. GCC has been ported to an MS-DOS environment (GCC), and it could probably compile with only a few changes under a Mac environment, but it'd be better to run Linux on both of them. That way, you'd be sure of getting a fair test.

BTA, it'd be much better to perform a series of tests on both platforms under the same environment. For example: Basic arithmetic (integer and floating point), memory copying, disk reads and writes (be sure to use the same hard drive), and probably some higher level tests which give out good looking numbers to satisfy the masses. :)

: >yesterday? Which is better?

: Compare a machine using the same number of the 604's as Intels machine
: uses Pentiums and the Intel machine looks like the technology is the
: technology of yesterday (and more expensive too), the technology of
: yesterday is the Pentiom and the 604 machine is better. I don't see
: your point.

My point is that no matter how good your thing X is, there's something
better in some way --- even if it uses older technology. Computer chips
are included. The supercomputer is obviously superior for pure power in
comparison to a single 604e or 620. But which uses the more recent
technology? The 604e and 620 do. Which is better? Probably the
supercomputer.

Well fine. If you are going to say my two favorite computers suck (Atari and Commodore), then to hell with you. If there's anything I hate using more than my PC, it's a fucking Macintosh. Okay, okay, when your new OS comes out, every problem will be solved.

Well excuse the fuck out of me for not using your latest "System" (great fucking name for the OS by the way), but I have been irritated by the following things using Macs in the past: When I used to run apps off of floppys, why the fuck does it have to keep writing to the disk? When the hard disk or floppy disk is being accessed or formatted, why the fuck does everything lock up so I can't do anything else? Why the fuck do I have to drag a floppy disk to the trash to eject it? Is that supposed to be intuitive? I think not. Designed like a user would normally do things my ass! When I toss something in the trash I expect it to fall into a pile of rotten banana peels and fish heads, and to generally get fucked up, not to eject! And why isn't there a fucking eject button on the disk drive? I'm not a baby, I know when I want the disk out. Then when the Mac crashes, that stupid bomb comes up, and since I don't trust the computer I have to stick a paper clip in the little hole to get the floppy disk out. And why the fuck can't I just shut the computer off when I'm done like on my Amiga. Why should there

be a shut down procedure? Can't the "system" save statistics as it goes along? I have the same beef with Windows. When I am printing, why do I have to wait a fucking hour for my fucking document to print out? So my school was too cheap to use a printer buffer, but have you ever heard of a background print spooler? So maybe your latest version of the OS can do this, but what took so fucking long?

My Amiga solved those such problems 11 years ago. ELEVEN YEARS!

That's a long time, no matter how you twist it bonehead! Microsoft Windows solved those problems from the outset too. Also, why the fuck does the Mac "system" copy shortcuts when I really want to copy the whole file? And where's the fucking command line interface? Sure, sure, you want people to visualize these objects, but we all really know it's just a bunch of files on a disk making it all work, so let me at them already.

And why does software designed for the Mac look so graphically drab? How long does it take to get used to the fact that the computer is capable of displaying a whole lot of colors? At least Microsoft makes it's stuff colorful. I never could understand why the old Macs were made in monochrome. Color was too expensive? Not for the Amiga or ST it wasn't.

I have an Atari, two Amigas, and a PC, and some old childhood computers, but I will never buy a Macintosh. The Macintosh simply has no advantages. The Atari and Commodore had no good ideas? Fuck that noise. They were the last "good idea" machines. Okay, there is the BeBox now, but who knows if it will go very far. Hopefully they don't make the interface too much like the Mac. The Mac was built around the way people think? Bullshit. I don't know of any scientific study that suggests guidelines for intuitively using a computer. The Mac tries to be failsafe and ends up being annoying. Only when you get used to the Mac do you start to think like it, and then you turn into a bigot that can't rationally consider the virtues of other platforms. So there are

gunna be new Macs with faster processors, faster than the fastest Pentiums? Well DEC Alpha servers are dropping in price. I can buy one of those and run Win NT. An Atari dealer has just offered some two-hundred something mhz. Alphas for about $1200.

Take your Mac and shove it up your hippy, touchy-feely, tye-died, liberal elitist, sensitive-artist type ass! Okay, so that's a stereotype and even Rush Limbaugh likes the Mac, but who gives a fuck.

My point is that the Mac sucks.

Okay, now it's your turn to tell me I suck. Then it will be my turn again. And then I will say you suck harder and you swallow for extra money. And then......

Who cares what the original point was. New points were brought up.
Namely the unjustifiable bashing of the Atari ST and the Amiga.

Well fuck that too! The C-128 was a good value when it was new. The
Amiga had just come out when the C-128 was released, but it was
expensive compared to the C-128 (but it was a bargain compared to a PC
or Mac), and the Amiga didn't have much software yet. The C-128 was a
good option because it was cheap and it ran all the C-64 sofware.

This should be very easy to show. I gave a configuration and a price. All
you have to do is give me a similar configuration with a similar price.

Unix is 70's based & VMS is 60's based but both will stomp all
over MacOS or MicroSponge wares.

Digital Research managed a feat that Apple could never manage.
They produced a 192K OS/GUI. No amount of Apple cheerleading on
your part can change this.

>
>The 7200/75 can run fine with 8 megs of memory when using low memory apps such
>as ClarisWorks, WriteNow, Nisus which have no equals in the ST platform.

What does ClarisWorks have that AtariWorks doesn't? What does Nisus
writer have that WordPerfect doesn't & what does WriteNow have that
WordWriter doesn't? And why should we care? Will we ever need it?
Will we ever use it? Will we ever care?

How will it better suit someone (anyone) who's needs with Atari
may be lacking?

8Megs and Low memory apps are oxymorons.
Also, which of those will be using VM, thus slowing them down
to XT speeds...

>Considering the price is $999 which includes 4x CD and two ethernet ports which
>are expensive extras on the $999 Falcon.

Actually, the ethernet port is included on the Falcon.
Furthermore, a second ethernet port is a pure absurdity.
Nevermind that an ethernet port is one of the more esoteric frills.
A 4x CD can be had for 60bux these days; the benefit of
wider hardware support.

Not in CompUSA, they're not. But, we've already established
that you're out of touch with their product anyways.

>
>>>CompUSA in Des Moines.
>>
>> You are LYING. CompUSA doesn't sell IDE 2 gig drives for that cheap.
>
>Yes they do..According to their Sunday insert in the paper. Shocking is it?
>Need to spend more time in the present and not in the past.

Odd that such a great price is nowhere to be found on their webpage.
For a retail establishment 200bux for a 2 Gig drive still is rather
remarkable.

Perhaps you could post it here.

The closest thing to that deal that they ACTUALLY have is a $300 dollar
Maxtor 2 Gig drive. No, the rebate doesn't count: CompUSA is still selling
it for $300. (regardless of manufacturer's rebates and misleading ads)

...and you're still a liar.

The Falcon030 with 1 meg would not.

Such a machine was produced, and made available for sale. 'Twas more a "low price" model than a "you can do things with it" model. A failing of many a company that wishes to appear affordable to Joe Public. (Apple, C= and Atari all fall into this category equally)

Given the capability of the machine, it may be able to run "hello world" but little more.

I don't recall it ever being bought by anyone I know, though.

_I_ certainly would not purchase such a crippled (highly colourful, sound processing "friendly", with _only_ one meg of RAM) machine. I'd up-spec it somewhat. 8+ megs of FREE ram after all required OS and video ram is loaded would be one requirement. Another would be a hard drive of perhaps a gig or three - depending on how disc space intensive my intended use is.

The example I have chosen here is extreme. But real.

Example of other crippled machines include cacheless PowerMacs 6100, 7100 for example. Performance was crippled beyond belief. And C= could probably have a lengthy list of "cripplings to meet a price point" as well.

I would be. Although, some users need 100Mflops and 64Megs to get
ANYTHING done.

That's the advantage of legacy GUI apps that can actually do productive
work within 1Meg or less.

It's still a very dodgy comparison, the markets that you mention are
very small probably tens of units a day in the case of SGI, in the PC
market it's like tens of thousands, some markets are too small to be
worth competing in. If I decided to set up a company that specialises
in breeding Cockroaches for racing purposes I could probably establish
a 100% market share easily, if I was to make VCR's then probably more
likely to be 0.00001%. 8.8% in a *MASSIVE* market like the PC market,
especially when you had to pay the incredible R&D costs and compete
against people who didn't, is in my opinion a very good share, I
believe theye are in something like the top 3 PC makers in the world
still(true?).

OK, whatever.

When I have some free time (I have to work, you know) I may check out prices on Alpha systems. From recent press releases, I've seen 400/500 MHz Alphas starting at $17,000. Now, how much would a comparable Mac clone cost?

The above does not necessarily represent views of my employer,
my educational institution, or of myself.

Such a system does not exist in any single processor Mac system. I suspect
that you would need to buy a Genesis 4x604 processor system. I believe
that the starting price is about $15000 but I really don't know. Why
are we now comparing the price of massively high-end systems?

Since the fraction of lynx users is so tiny, I bet that it is not
considered by Web designers.

I do have access to Netscape and I still think frames SUCK. As you mentioned they do produce this hacked up recursive browser effect which is not usually even correctly constructed. My browser navigation controls suddenly become useless and are seldom replaced within the frames. Furthermore, frames suck up memory/resources like you wont believe. Some lower end PC/Macs are as capable of displaying these pages as a DECVT-420 running Lynx...

Not quite true. There are many less self-centered developers that
actually acknowledge that the entire world is not running the same sort of
hardware and software that they are. The rude part of the web is actually
quite small.

It's not being self-centered. It's recognizing that it is of almost no
value to support lynx because they represent such a small part of your
potential customers.

>all be using.

Yes, the Alpha is superior and if they created a relatively inexpensive system
then, yes, that is what we should all use. But it has not been demonstated
that DEC makes such a system. I really wanted an Indigo Impact at work
but I didn't get one because they cost way too much. But they ARE better.

> But that still doesn't go up to 400 or 500mhz.

The sum of the MHz speed of all the processors would be 480MHz.

> So we get an inferior computer for a cheaper price. Fair.

Very true.

> To prove a point.

I don't understand your point. Is it that Macintosh is a superior system
but costs too much?

Yep, and opposed to "far superior" MacOS, Atari OSes are

- multitasking preemptively
- faster in any GUI operation (while not dropping device independance)
- dynamically allocating RAM (as opposed to the stone-age MacOS static RAM allocation crap).

>The 7200/75 can run fine with 8 megs of memory

It's time to for a little education.. A 586/133 is equivalant to a Pentium 90.
A Cyrix 586/133 with the motherboard can be had for less than a $100.
Next time know what you are talking about before you move your lips. You don't
what to look like an idiot..

>when using System 6 and System 7.1. Nothing efficient about the Atari OS
>considering it still 1980's based.

Jabba said..
Unix is 70's based & VMS is 60's based but both will stomp all
over MacOS or MicroSponge wares.

Digital Research managed a feat that Apple could never manage.
They produced a 192K OS/GUI. No amount of Apple cheerleading on
your part can change this.

I said..
Thats interesting, didn't Apple produced a 128k OS/GUI. As the time progressed
Apple added features and functionality while the Atari OS stagnated. Not
impressive at all.

The ST OS is bloat compared to the Atari 8 bit OS. Isn't the Atari 400 had
only 16k?

>The 7200/75 can run fine with 8 megs of memory when using low memory apps such
>as ClarisWorks, WriteNow, Nisus which have no equals in the ST platform.

Jabba said..
What does ClarisWorks have that AtariWorks doesn't? What does Nisus
writer have that WordPerfect doesn't & what does WriteNow have that
WordWriter doesn't? And why should we care? Will we ever need it?
Will we ever use it? Will we ever care?
How will it better suit someone (anyone) who's needs with Atari
may be lacking?
8Megs and Low memory apps are oxymorons.
Also, which of those will be using VM, thus slowing them down
to XT speeds...

I said..
Power and a future. AtariWorks is an unsupported app by Atari and has not been
improved upon. Not surprising considering that Atari is the publisher.
Nisuswriter, Clarisworks and WriteNow would be considered high end on the ST
platform considering that no equivelants exist.
Low memory/high powered apps exist and is not an oxymoron and yes Virginia VM
is not needed and the speed is not slowed down. Jabba you need a clue.

>Considering the price is $999 which includes 4x CD and two ethernet ports
which
>are expensive extras on the $999 Falcon.

Jabba said..
Actually, the ethernet port is included on the Falcon.
Furthermore, a second ethernet port is a pure absurdity.
Nevermind that an ethernet port is one of the more esoteric frills.
A 4x CD can be had for 60bux these days; the benefit of
wider hardware support.

I said..
The CD is still an exta option that costs money. CDrom is not officially
supported by Atari. I hav been to software stores and have not seen Atari ST
CDrom software.

Jabba said..
Compudyne 14" monitor that CompUSA sells. Tell me how to hook it up
to a mac without any additional cost.

Try hooking it upto a ST/Falcon with out extra cost.

>The vast majority of Macs are shipping with at least 1.6 Gig and 2 Gigs.

Not in CompUSA, they're not. But, we've already established
that you're out of touch with their product anyways.

I have Apple's latest shipping configurations from MacWeek, the average
shipping HD is 1.6 Gig.

>>>CompUSA in Des Moines.

Jabba said..
>> You are LYING. CompUSA doesn't sell IDE 2 gig drives for that cheap.
>
>Yes they do..According to their Sunday insert in the paper. Shocking is it?
>Need to spend more time in the present and not in the past.

Odd that such a great price is nowhere to be found on their webpage.
For a retail establishment 200bux for a 2 Gig drive still is rather
remarkable.

The closest thing to that deal that they ACTUALLY have is a $300 dollar
Maxtor 2 Gig drive. No, the rebate doesn't count: CompUSA is still selling
it for $300. (regardless of manufacturer's rebates and misleading ads)

...and you're still a liar.

I said..
Sorry, the rebate does count and the price was/is $199! Get over it!!
I am a liar? You are out of touch..

500 megs are ridiculous for a Mac - they might suffice for an Atari, but
then - Atari apps usually ship on two or three disks.

I said..
Macs shipping today have at least 1.6 gigs today. You must be referring to a
closeout model that was released in 1995. I have seen yesterday Pentiums with
500 megs..

And your evidence for that claim is...?

Ever heard of proxy servers (Netcrap users don't know how to use them,
usually, so it's hard to guess if they know about them at all)?

Thorsten

I would imagine that, if you were told you were getting a 30 percent pay cut,
you wouldn't consider it "tiny." Yet when it doesn't affect you personally,
30 percent is a "tiny" fraction of Web browsers?

Yes, too bad they don't allow students at U.N.I. to have a lunch hour; then he might realize that, even at Intel, people aren't required to work without surcease for the entire day.

That's a vast oversimplification. Certainly there are hundreds of
applications written for the 1040ST tha run quite happily in 1 meg of RAM.
More colors than the three ST resolutions allow would be nice, but aren't
/required/ to be useful.

> 8+ megs of FREE ram after all required OS and video ram is
>loaded would be one requirement.

Considering that the OS requires next to no RAM (it's in ROM, remember?), and
that even running a 1 gig drive on my 1040ST is quite comfortable, video RAM
is the only consideration that really applies here. Certainly, I wouldn't buy
a Falcon with 1 meg of RAM, but then, I'm accustomed to a minimum of 4 (my
Mega STe, and my uprated 520ST before that) and will probably uprate the 1040
Real Soon Now. People who haven't ever use an ST with more than 1 meg would
be comfortable enough.

Errm, because they are available? Actually, these are not "massively high-end".
Massively high would be something with a dozen or so of Alphas in it (and they
do exist).

By the way, adding up CPU speeds, as you do in another message is meaningless on
any platform, and especially on Mac, with its rather limited support for
multitasking and multythreading, and mostly non-threaded software base.

Unfortunately, Digital does not list prices for their recent systems on theitr
Web site (or at least I could not find them), so I still can't give you a proof
with URL and everything...

Say, can I plug a nice Digital's or Intergraph's video card with 24MB of RAM,
Z-buffering, double-buffering, subpixel precision, etc., into your Mac clone?

: when read with Lynx.

Really? You find pages with messages? Usually, I find completely
blank ones. I have only found one page which has separate frames and
non-frames version. It was (it's not maintained anymore) devoted to id
Software's game Quake, and was entitled Aftershock. The author generated
the HTML file through some method which allowed him to keep one version
of the source and have both frames and non-frames versions available.

I wish more people would use systems like that if they insist on using
incompatible and proprietary tags.

Well, I'm not really sure why we're discussing Alphas. You 've given a price quote intended to show that a Mac clone is price-competitive with a Pentium-based PC. I replied saying that even an Alpha (much faster) system is priced at about the same level, i.e., that Mac clones still do not offer a definitive price advantage.

I'm not saying that Macs don't have any advantages (even though I, personally, don't like them), and there are some Mac-only software titles, so for some applications Macs make a lot of sense. However, IMHO, with the recent improvements in PC's and operating systems available for them (at least for the kind of things I do with the computer, NT is much better than MacOS, for various reasons, stability being one of them), capability of running a dozen or so of Unix flavors, NeXTStep, NT, Solaris, Linux, etc., as well as with the availability of Alpha and MIPS-based systems at very competitive prices, Macs, at least from my point of view, can not compete on either price or OS feature basis.

The above does not necessarily represent views of my employer,
my educational institution, or of myself.

Thats very interesting. Last time I checked the price/performance of the
Falcon, looked like Lexus pricing. But the Lexus is worth every dime.
PowerMacs/Pentiums perform in the Lexus class with Escort prices.

Where are you getting that 30% number? Netscape claims that 80% of web
browsing is done using Navigator. A lot of windows users are probably using
Internet Explorer.

>Thats interesting, didn't Apple produced a 128k OS/GUI. As the time progressed
>Apple added features and functionality while the Atari OS stagnated. Not
>impressive at all.

Apple never produced a compact OS. They managed to squeeze some of
it into system ROM but, system was always disk based and LARGE.

The ST is still better engineered than even your most current macs.
The OS was appropriate to the power of the hardware and the resources
available. It did not bog down the user with quite a bit of fluff that
would be unusable anyways.

>
>The ST OS is bloat compared to the Atari 8 bit OS. Isn't the Atari 400 had
>only 16k?

The ST also does quite a bit more. Furthermore, what 'bloat' the ST
does have is not a hinderance to the user. Even the most basic ST
can be quite productive. The OS doesn't get in the way and eat up
half or more of the system's resources and performance.

Despite being a relic, an ST can more completely take advantage of
its feature set than newer more powerful machines.

>

>I said..
>Power and a future. AtariWorks is an unsupported app by Atari and has not been

These aren't features. These are advertising buzzwords. They don't
get any work done. They are useless to anyone but mindless clones
like yourself.

>improved upon. Not surprising considering that Atari is the publisher.
>Nisuswriter, Clarisworks and WriteNow would be considered high end on the ST
>platform considering that no equivelants exist.

This is an assertion that you've yet to support. It is not unlike the
majority of your rants in this respect.

>Low memory/high powered apps exist and is not an oxymoron and yes Virginia VM
>is not needed and the speed is not slowed down. Jabba you need a clue.

No VM for Nisus under 8M? I highly doubt that. Those box specs do
tend to be so understated on Mac's/PC's. Is this experience talking
or just more hot air.

Furthermore, if it does need 8M all to itself and it will in fact
start swapping out pages if you run anything else than, your precious
Nisus has effectively turned your powermac into a FatMac or ST.

For if any serious apps nullify the usable multitasking aspects of
your OS, you might as well be running an ST.

...and you've still yet to state one REAL feature that any of these
have that any of US would want or need, let alone something that
we may not be able to get with our own wares...

>The Great Liar Said..
> Sorry, the rebate does count and the price was/is $199! Get over it!!
>I am a liar? You are out of touch..

That tactic borders on fraud and is as slimey as you are.
If 300 bux goes on my AMEX, then the price is $300 NOT $200.

Nevermind that the drive in question is IDE NOT SCSI and that
it is from a brand notorious for poor interoperability: Maxtor.

An 8Meg Low Memory App is an Oxymoron.

: value to support lynx because they represent such a small part of your
: potential customers.

Who said anything about lynx? Netscape Exten$ions are **Netscape**
exten$ions. This means: If you *do not* browse the Web with Netscape you
are screwed. This includes: M$ Explorer, Lynx, Mosaic, Slipknot, older
versions of Netscape, and lots of other commercial browsers (most of
which are based upon Mosaic, which is HTML 2.0 complaint).

And so you would delightfully screw everyone who does not comply with
your choice of browser, simply because they have a different opinion.

: In what way? And how very likely? Or is this Jabba speak?

Internally the Cyrix 586 is structured as a 486 is. It's designed with
a 32-bit bus, the same number of registers, the same instruction set (I
could be a little wrong there), but the main diference is that it runs
faster at the same clock speed. Unfortunately, this comes at the cost of
compatibility, because there are some apps which use 'illegal'
(undocumented) 486 instructions which do not run on the Cyrix.

If you want to buy Cyrix's Pentium clone, get a 686.

(BTW, it's useless to argue this, Petey. It's the truth, and you can't
fight the truth. Want me to drag one of the chip groups into it? Then
you'll really look like a fool.)

>Never mind that the Cyrix 586/133 has the speed of a Pentium 90. What part do
>you not understand?

The notoriously absent part detailing just why the Cyrix 586 is such
in anything but name only. NO technical details were given. ONLY a
performance spec was given and that performance spec puts it next to
the AMD486/133 also refered to as a 586. Furthermore, the performance
spec is linearly scaleable to the peformance of any other 486 chip
most notably the AMD or i486DX4/100 and AMD486DX4/120.

>
>>
>>>Next time know what you are talking about before you move your lips. You don't
>>>what to look like an idiot..
>>
>> It performs like a 486; it very likely is a 486...
>
>In what way? And how very likely? Or is this Jabba speak?

Very slowly once again for the anacaleptic:
Overclock a 486DX4/100 to 133Mhz and it will
perform the same as your so called Cyrix 586.

They actually sell such beasties. They are
called AMD 586/133's. These are just fast
486's; this is common knowledge in the field.

Mind you, this is all according to the CPU
performance specs you gave. They are quite
likely bogus.

Cyrix in general is something to be avoided becuase they
are a little TOO cheap. Stick with AMD (same price & perf.).
Cyrix is notorious for incomplete implementations (personal
experience) and misleading labeling.

: >all be using.

: Yes, the Alpha is superior and if they created a relatively inexpensive system
: then, yes, that is what we should all use. But it has not been demonstated
: that DEC makes such a system.

Actually, I don't think that they make an inexpensive system. Their systems are quite expensive, and from a couple of the price quotes I've heard on here ($9000 is the highest), the prospect of getting a used system from a couple of years ago for the same price as a Mac sounds pretty good.

: I really wanted an Indigo Impact at work
: but I didn't get one because they cost way too much. But they ARE better.

That sounds like me begging the CS teacher to ask for something really outlandish (like Suns) when he writes up the next grant proposal. I really want one, but we won't get it (he won't even mention it) because they cost way too much. But they ARE better. :)

: > But that still doesn't go up to 400 or 500mhz.

: The sum of the MHz speed of all the processors would be 480MHz.

That doesn't mean that it would be equivalent to 480mhz. If everything was optimized for multi-processor systems, then it would certainly be worth at least on 480mhz processor.

But very little on the market today is intended for multi-processor systems. There are a few multi-threaded programs out there, but not many. Certainly fewer than to make it worthwhile.

: > To prove a point.

: I don't understand your point. Is it that Macintosh is a superior system
: but costs too much?

You rant and rave about the Mac being superior. There's always something superior out there, even to your Mac, so why make such a big fuss about it?

5460. Nothing is best

Newsgroup: comp.sys.atari.advocacy
Date: 1996-08-14 00:00:00 UTC
From: ha-user@ux-01.bg.bib.de
Message-ID: <4us3re$pge@ux-01.bg.bib.de>
Source record: 8569

OK, I've read the stuff posted to this group for quite a while now,
and I must say that each of you has a point. For a Mac fanatic like
Mr Sinclair-Day, the mere thought of trading his PowerMac in for a
68030 or 68040-based Atari system must seem ridiculous. For the
Atari fanatics here, myself included, the mere thought of switching
to a system that can neither allocate memory dynamically nor perform
pre-emptive multi-tasking must seem equally out of question.

Considering this, don't you think that this whole war is a little
strange? No Mac user will ever buy an Atari, and no Atari user ever
will buy a Mac except for emulating MagiC on it and maybe run a few
Mac apps that have no Atari equivalent. So what's the point in
debating whether an Alpha or a PowerMac is better value for money?
Will any of you ever actually buy an Alpha? And if so, which OS are
you going to run? Windoze NT? Unix? Any of these a real alternative
to either MacOS or MagiC? I think not.

So, if you are happy with your Mac, congratulations. If you are happy
with your Atari, ditto... and let me call you 'brother'. ;-)))
If you are happy with anything else, well, why shouldn't you? You're
quite an intelligent person too, I assume, and you won't have bought
anything tht doesn't suit your needs.

But why can't you all just be in peace with the knowledge that there
are people out there who had their reasons to buy something else?
Oh, yeah, sure, this is advocacy, I forgot. Well, it feels like war,
or kindergarten, or soul asylum to me. Anything has its advantages,
even Windoze does. And anything has its master... so don't make computers
a religion, what do you say?

Yours,
Erik.

>browsing is done using Navigator. A lot of windows users are probably using
>Internet Explorer.

Very unbiased source versus, say, a recent marketing study commissioned by
a major Boston firm that I have contact with. In short, use of proprietary,
non-open standards shuts out a huge portion of the Internet userbase, which
is why NO advertising or marketing firm worth its druthers encourages sites
to use proprietary technology to the point of completely shutting out the
users. Percentages are nice, but if even 1% of Internet users were shut out
due to non-HTML-compliant pages, that would exclude at least 300,000 potential
users from seeing your page, and 300,000 potential customers from reading yout
materials.

AHAHAHA! What's this, Peter? Join the Revolution! Spread the good word
about Apple computers! Advocate Apple computers in whatever you do!
Join the cause!

ROTFLMAO! This sure sounds like the "Atari Revolution" of 1990.
Heh heh, Apple's path continues to follow the same path Atari
followed back in the early 1990's... a path which leads to oblivion!

/Kevin

HAHA! Denial, Peter... classic denial. You still are a worthless amoeba
and your delusions are innumerable.

Apple 1996 = Atari 1990

Apple X = Atari 1996 (death)

The only thing left in doubt is the exact value of X. 1998? 1999?
Or even sooner?

: I wouldn't want to venture a guess to the number or
: percentage of people using Lynx, but here at Nyx there
: are well over 5,000 user accounts (if not more) and
: we use Lynx. How many public access unix sites are
: there like Nyx? How many freenets? How many other
: unix shell account providers?

I know here at CRL, we have well over 4,500 users (exactly 4699 from a
wc -l on /etc/passwd, but that includes non-user "users").

Plus, extending on something you mentioned in another of your articles,
the whole San Francisco Public Library system is hooked up to the
Internet and provides Lynx. You can dial in or use one of the many
terminals they have at the various branches of the library (at least four
or five in each branch (at least 50 at the Main), and there's 27 branches
plus four Children's Rooms which also have 4 or 5 terminals) and access
Lynx through there. (it's actually fun to plug in a URL to telnet to your
ISP... They unknowingly (apparently) provide a telnet service. :)

5469. Draft RFD: comp.binaries.atari.{,discuss}

Newsgroup: comp.sys.atari.advocacy
Date: 1996-08-14 00:00:00 UTC
From: "Kyle R. Hofmann" <rhofmann@crl.com>
Message-ID: <4utbeo$si9@nntp.crl.com>
Source record: 8578
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

```
[ This is a draft version of an RFD intended to be posted to
news.announce.newgroups soon. It is being posted to the comp.sys.atari
groups for feedback before the final submission to David C. Lawrence,
the news.announce.newgroups moderator. Please give us your thoughts on
this proposal. Thank you. --KRH ]

REQUEST FOR DISCUSSION (RFD)
moderated group comp.binaries.atari
unmoderated group comp.binaries.atari.discuss

Newsgroup line:
comp.binaries.atari Binaries for Atari computers. (Moderated)
comp.binaries.atari.discuss Discussion of content of c.b.a.

Proponent: Rich Tietjens <starship@3rdplanet.com>
Proponent: Kyle R. Hofmann <rhofmann@crl.com>
Proponent: Adam B. Roach <adam.roach@exu.ericsson.se>

This is a formal Request For Discussion (RFD) for the creation of
world-wide moderated Usenet newsgroup comp.binaries.atari, and
unmoderated comp.binaries.atari.discuss. This is not a Call for
Votes (CFV); you cannot vote at this time. Procedural details
are below.

RATIONALE: comp.binaries.atari

Currently, there exists no appropriate and easily accessible medium
for the release of Atari software. There is also a growing pool of
software available for these machines which would recieve a
marginal distribution at best due to this lack of a medium.
Though FTP sites and several binaries newsgroups
(alt.binaries.comp.atari8bit and alt.binaries.atari) exist, many
Atarians do not have FTP access and the alt groups have a poor
distribution.

By creating comp.binaries.atari, a medium would be established.
comp.binaries.atari would provide a method of distribution. With
c.b.a, the immediate dissemination of new releases and bug fixes
would be possible.

This method also has the advantages of using comparatively fewer
system resources than other methods, and of keeping binaries out
of existing comp.sys.atari.* discussion groups.

END RATIONALE.
```

RATIONALE: comp.binaries.atari.discuss

The existence of a .discuss group allows the discussion of the binaries groups to stay separate from the actual binaries postings and from non-binary related postings. Without a discussion group, non binary posts related to the topic of the binaries heirarchy have no single place in which they can be discussed; instead, they are spread around a heirarchy of newsgroups, making worthwhile discussion difficult, if not impossible. This discussion group will create a proper place for discussion and comments on binary software posted in the comp.binaries.atari.* heirarchy.

END RATIONALE.

CHARTER: comp.binaries.atari

For the distribution of Atari compatible or Atari related software. This includes bugfixes, updates, and new releases to Atari computer software and software on other platforms related to Atari computers (such as emulators, disk image maintainers, and Atari to PC communication software). Software that has been posted within the last 60 days will be rejected; no reposts will be made within that time period. Non-binary or non-software submissions will be rejected.

The moderator will cancel any post which has been posted with a forged approval header.

Specific examples of allowed software include:

- Freely distributable software
- Revisions of previously released software
- Bugfixes of previously released software
- Commercial software with the explicit permission of the copyright holder

Specific examples of disallowed software include:

- Pictures, music, and other non-software binaries
- Recently posted software (posted within the last 60 days)
- "WaReZ", pirate software posted illegally without the copyright holder's permission
- Discussion of software posted to comp.binaries.atari
- Requests for software
- Reposts of software previously posted

END CHARTER.

CHARTER: comp.binaries.atari.discuss

This group is for the discussion of binaries posted to the group comp.binaries.atari. On topic posts include:

- Asking for alternate methods of distribution for a binary
- Discussion of the relative merits of a particular binary in comparison to competing packages
- Requests for a piece of software which has not been posted recently
- Requests for a piece of software which was incomplete to be mailed

Binaries, spams, MAKE.MONEY.FAST schemes, computer advocacy, and discussion not pertaining to the comp.binaries.atari groups is considered off topic.

END CHARTER.

MODERATOR INFO: comp.binaries.atari

Moderator: starship@3rdplanet.com (Rich Tietjens)
Backup moderator: rhofmann@crl.com (Kyle R. Hofmann)
Submission address: starship@3rdplanet.com

The moderator is author of a number of freeware packages for the TOS compatibles, active in the various Atari discussion groups, several fido-technology networks, and is employed in the networking industry.

END MODERATOR INFO.

PROCEDURE:

The discussion period lasts 21 days from the initial post of this RFD. If there are no major objections to the naming or placement, then the CFV (Call For Votes) will be issued, lasting for at least 22 days. Following the vote, there is a 5 day discussion period after which newsgroups that passed will be newgrouped by the moderator of news.announce.newgroups.

Followups to this post are directed to news.groups, which is where further discussion will take place. Cross-posted followups are discouraged. Please read news.groups to participate. Thank you!

DISTRIBUTION:

This RFD has been crossposted to:

news.announce.newgroups, news.groups, comp.sys.atari.8bit, comp.sys.atari.advocacy, comp.sys.atari.st, comp.sys.atari.st.tech, comp.sys.atari.programmer

> it into system ROM but, system was always disk based and LARGE.

Depends on your diffinition and opinion. Not fact. Also Apple has advanced
the OS far more than the other OS. Thats the fact Jack!

> The ST also does quite a bit more. Furthermore, what 'bloat' the ST
> does have is not a hinderance to the user. Even the most basic ST

> half or more of the system's resources and performance.
>
> Despite being a relic, an ST can more completely take advantage of
> its feature set than newer more powerful machines.

More Jabba speak. The OS doesn't do much. Were are the equivelant Mac/Windows
apps. Were are the equivealnt Mac/Pentium hardware at lower prices to boot?

Considering that Mac/Pentium systems come standard with more than enough
resources to boot, your asertion that the OS gets in the way (what ever that
means) is a fallacy.

> These aren't features. These are advertising buzzwords. They don't
> get any work done. They are useless to anyone but mindless clones
> like yourself.

Advertising buzzwords? AtariWorks 1.0 is the same AtariWorks 1.0 when released
four or more years ago. So I am going to depend on a app that will never be
improved upon from the remaining four employese at Atari? You would make for a
lousy entrepreneur who is a afraid of change and progress.

> No VM for Nisus under 8M? I highly doubt that. Those box specs do
> tend to be so understated on Mac's/PC's. Is this experience talking

>

Are you fucked in the head? As I stated that the Cyrix 586/133 is a good
alternative to a Pentium 90 and 100 due to speed and cost. You can put a nice
system together for about $600-$800!

>>In what way? And how very likely? Or is this Jabba speak?
>
> Very slowly once again for the anacaleptic:
> Overclock a 486DX4/100 to 133Mhz and it will

>> its feature set than newer more powerful machines.

>More Jabba speak. The OS doesn't do much. Were are the equivelant Mac/Windows
>apps. Were are the equivealnt Mac/Pentium hardware at lower prices to boot?

You're talking out of your butt again. The overhead to run Mac and Windoze
apps is quite large- in fact, much more overhead is needed with those
platforms versus the ST and Amiga. MacOs and Windoze apps
require high amounts of memory, vast volumes of disk space, etc.

>Considering that Mac/Pentium systems come standard with more than enough

Look who's talking! You can't even admit that Apple is going down the
tubes! Their market share dropped from 7+% to 5% in the last 8 months!
In 1990, Atari had 4.5% of the computer market in North America and
a MUCH BIGGER share in Europe. Market-wise, Apple is in worse shape than
Atari was in 1990!

>> Regarding retail prescence: this damns Macs MORE than it does STs.

Well, you turned this back into advocacy so... PowerComputing has stated
that they will continue to bundle their computers with MacOS so Apple
still gets the profits from that. PowerComputing still buys their
motherboards from Apple so Apple will still get profits from that.
Also, Apple's single processor is faster than both of the Be's processors.
Apple has been releasing a lot of technical data lately and they are
moving towards PPCP which does not make them closed. Bes right now run only
on propriety hardware (Be's own hardware, not PPCP), Apple's current
hardware is superior to Be's hardware and you can get a Mac clone for
cheaper than a BeBox.

The fact is that Macs are good machines. Many Mac users are perfectly intelligent people. The problem here is not the Mac, it's not the Falcon, and it's not actually anything to do with /any/ computer. The problem is Peter Sinclair-Day, who knows nothing about anything but thinks he knows everything about everything (I understand the situation, ahving outgrown that syndrome some twenty years ago myself. Yes, there are many topics upon which I cannot converse intelligently. Computers, however, is not among those). If the people who actually have and use Macs were to compare notes with the people who actually have and use Atari systems, we would find that we have much in common - including a perfectly realistic disregard for MS dozzzzze and for loud-mouthed bratty smartasses who get by at the university on Daddy's money and MacWorld's opinions (as presented in the adverts by Madison Avenue).

And that's the news...

Yes - this takes the last profit center for Apple (sales of the Mac OS)
and makes them redundant. It also provides a way out to a superior platform
for Mac users who want something better. Thus, people move from a single
processor, proprietary, closed, limited, expensive Mac to an excellent,
affordable, open BeBox.

: >

: Are you fucked in the head?

No, you are.

: As I stated that the Cyrix 586/133 is a good alternative to a Pentium
: 90 and 100 due to speed and cost. You can put a nice system together
: for about $600-$800!

This coming from the person who couldn't care less about PCs. Really.
The truth is that Cyrix makes inferior chips. The floating point
processor on the Cyrix 686, for example, is complete crap, even by PC
standards. The 586 isn't even a Pentium, so don't compare it to one.

: >>In what way? And how very likely? Or is this Jabba speak?
: >
: > Very slowly once again for the anacaleptic:
: > Overclock a 486DX4/100 to 133Mhz and it will
: > perform the same as your so called Cyrix 586.

: And performs comparably to a Pentium 90 and 100! What is your point?

That the 586 is actually a 486, and 486s don't perform comparably to
Pentiums.

: > They actually sell such beasties. They are
: > called AMD 586/133's. These are just fast
: > 486's; this is common knowledge in the field.

: And costs less than their Pentium counterparts.

And are rightfully inferior.

: > Cyrix in general is something to be avoided becuase they
: > are a little TOO cheap. Stick with AMD (same price & perf.).

: > Cyrix is notorious for incomplete implementations (personal
: > experience) and misleading labeling.

: Now you state that Cyrix needs to be avoided because they are a little to
: cheap?

I'll agree to that. Too cheap, in this case, means they don't pay
their engineers enough.

: According to Industry opinionaters that Cyrix is awesome that is their
: chips and 686 motherboards.

First of all, WTF are "Industry opinionaters"? Second, Cyrix is not
"awesome". Try comparing a Cyrix 686 133mhz to a Pentium 133mhz using
real world applications. For example, have 3d Studio render the same
scene on both computers. Play a game such as id Software's Quake.
Recompile GCC. All of those are time consuming tasks (especially the
second >:-) which depend heavily on the speed of the processor. BTW,
make sure you chip swap instead of getting two identically configured
computers.

: SOUNDS like you like to spend more for less.

BZZT Wrong!

> Atari was in 1990!

Interesting...I just read that it was 6.9%... However in their key markets,
much higher. I don't see SUN and SGI showing up in the overall score.
However, both do well in their tended markets.

Hard to believe Atari had marketshare at all in NA...What about USA?

Moving to Intel? Always been an Intel shop at least in the library
departments. However, in the academic colleges, different scene.

The Apple campus reseller more than doubled Mac sales so far this year.

Actually, I have a couple of machines at work that have 512 megs of RAM. Pentium Pro multi-processors - yep, they're fast, all right. I think the less expensive model comes with 64 megs RAM and no hard drive for only 50 kilobucks.

Of course, they aren't much good for MIDI, but man, can they search-and-replace in MS Word. <EVIL GRIN>

I worked at Netscape tech support before coming over to Intel. Netscape is used by an estimated 80 percent of /graphical/ web browser users. There is still a user base of roughly 30% on the Internet who do not have graphical access; they use Lynx.

So? Just which Macintosh (or even Apple for that matter) shipped
with an OS compact enough that it could be shipped as system ROM
ONLY?

You could concede a small point, and move on, but you're too stupid.

>>the OS far more than the other OS. Thats the fact Jack!

This is an interesting bit of FUD considering where you are. For
the vast majority of the planet who are now fixated on Mac vs. PC
that might fly. However, we know better.

We know that instead of it being PC vs. Mac, it was indeed
PC vs. EVERYBODY. In the mid 80's, even unix was pushing the UI
envelope. Apple was not some lone vanguard. Microsponge was the lone
holdout unable to deliver a viable GUI.

Apple made a nice shell but, it's OS is still primitive and has yet
to surpass OS'es decades older than itself.

Of course GEM had to sacrifice some functionality. This is an
engineering decision. The system software was designed to be
appropriate to the hardware it was operating on. Considering
that it created a machine that was at that time a third the price
of a cheap 8088 clone and as usable as a Mac and only marginally less
usable than a contemporary clone, it was an effective tradeoff.

>
>"the other OS" - what other OS are you talking about?

That other OS that all the Cloners used instead of DR DOS and GEM...

>
>>> Despite being a relic, an ST can more completely take advantage of
>>> its feature set than newer more powerful machines.
>
>>More Jabba speak. The OS doesn't do much. Were are the equivelant Mac/Windows

The OS shouldn't do much. The rest is for applications.

>>apps. Were are the equivealnt Mac/Pentium hardware at lower prices to boot?

What do your banner apps have that we need? You have yet to show us
this. Since you are unwilling to do so, as doing so would expose how
really uninovative those wares are, we must assume that there would be
no advantage had by using them.

Our apps don't need Mac/Pentium class hardware to operate.

>
>You're talking out of your butt again. The overhead to run Mac and Windoze
>apps is quite large- in fact, much more overhead is needed with those

So true. So true. With what the Mac and PC's waste, an ST user could
run quite comfortably and productively.

>platforms versus the ST and Amiga. MacOs and Windoze apps
>require high amounts of memory, vast volumes of disk space, etc.
>
>>Considering that Mac/Pentium systems come standard with more than enough
>>resources to boot, your asertion that the OS gets in the way (what ever that
>>means) is a fallacy.

Computer users do more with their machines than merely turn them on.
If a user cannot load one of your wunder-apps without bogging down the
machine and turning it into a MacPlus, then it has little more value than
a MacPlus. If you can't load two of those wunder-apps at once without
slowling the system down to MacPlus speed, then it has little more value
than any Mac with System6.

This is not a fallacy. This is personal experience of mine and many
other Mac/PC victims.

How have our needs changed in 4 years? How have yours? If it does the
task in a satisfactory manner, then there is no need to change it.

>>improved from the remaining four employese at Atari? You would make for a
>>lousy entrepreneur who is a afraid of change and progress.

I am not an entrepeneur, therefore your comment is not germane. I ,
however, am a consumer. Like many consumers, I have many choices
vieing for my time and money. Instead of wasting money on the hardware
race or software that does not suit my needs any better than last
year's (or decades) software, I'll be cruising through the Bahammas next
week.

Enjoy your overpriced plastic box.

So? If it isn't broken don't fix it. Name some extra feature which
would be useful and you might score a point but seeing as you've
probably never even looked at an Atari machine for years it's not
likely you've ever seen it in action.

>> For if any serious apps nullify the usable multitasking aspects of

>
>What ST? None are being sold unless you are referring to the expensive FALCON
>AND THE ANTIQUATED $3000 040 Hades. I'd rather save money.

He didn't say go buy one. His point was that rather than waste his
money on a more expensive machine that does nothing more he would
rather keep the able machine that he has. If you "might as well be
using [something]" then it means pretty much "the same as" so why on
earth would you even think about buying something that does the same?

>> ...and you've still yet to state one REAL feature that any of these

Is it possible to just use comp.sys.atari.st to discuss stuff in comp.binaries.atari? Why create comp.binaries.atari.discuss? I know I won't go looking for something in c.b.a. unless I read about it in c.s.a.st as I don't intend to poke my nose in there if I can help it. Also, does it have to be moderated? Seems like that was the cause of problems before. And then, of course, comes the issue of: do we really need this. Right now I'd say we do, primarily because there is no satisfactory ftp site. I wish we could set up a really nice network of ftp sites (one in US, one in UK, one in Germany, France, etc...) that all mirrored the complete archive. U-Mich used to do this, but seems to have gone all rough around the edges.

These people are quite wrong. There are those who need, want and
deserve the full graphics treatment. The trend in my circles
(journalism) is to teach getting the textual information first, and
THEN deciding if the visual information is necesssary.
As the Web grows and gets more complex, there will be more and more
necessity for Web designers to do (a) index/ search programs (b)
quick-summary text ability (c) visual information and (d) finally --
audio.

Lynx is routinely taught in journalism courses as the preferred
search tool. For starters, you can use it with cheapest old machine
in the world. And the information is the same whether you found it
with a Sinclair Spectrum as with a DEC Alpha.

If I am not mistaken, that means that 80% of those using a GUI
are using Netscape. I wouldn't doubt it.
Those using gopher, archie, ftp, etc., without going though
netscape or Iexplorer probably outnumber the GUI users. I think
somebody should start gathering good stax.

>Specific examples of disallowed software include:
>
>- Pictures, music, and other non-software binaries

As it stands, there currently is no repository that I am aware of that supports pictures or music files. I collected the 8-bit Atari .MOD music files, and would like to be able to trade and/or collect more titles. As far as I know, there are no copyright restrictions on the MOD and related music files because they were generally released anonymously.

A blanket prohibition on all music files to be overly restrictive. The music and picture files specific to the Atari 8-bit computers are small, hard to find, and tradeable. I would like to see them allowed. This request does not extend to .jpeg, .gif or other modern formats, nor to material that is already prohibitted from the Internet.

Please modify the proposal to allow music and picture files specific to the Atari 8-bit computer to be posted.

- Anthony Maffia

As I understand, PowerComputing is licensing the Mac OS and the Mac motherboard
designs and giving Apple royalties on each machine sold. According to the
pundits Mac clones will sell over 300,000 units this year and exceed a million
in '97'...

The Mac is a closed limited, expensive platform like the ST?

: this proposal. Thank you. --KRH]

: Currently, there exists no appropriate and easily accessible medium
: for the release of Atari software. There is also a growing pool of
: software available for these machines which would recieve a
: marginal distribution at best due to this lack of a medium.
: Though FTP sites and several binaries newsgroups
: (alt.binaries.comp.atari8bit and alt.binaries.atari) exist, many
: Atarians do not have FTP access and the alt groups have a poor
: distribution.

You need to specify what kind of Atari software is going to be on here
(8-bit, ST, TT, Falcon, whatever). Seems one user seems to think this is
for ST stuff. I'm not even sure what format this is going to be for, myself.

And if this is for 8-bit, there's already an 8-bit binaries group that
doesn't get wide distribution.

I completely agree. I remember having an extensive collection of Atari
art and certainly would like to see all that be back in circulation.
There were BBS's with literally hundreds of original art and musical
items. Where are they now?

You like parroting this remark but, you never manage to support them.
It really doesn't matter if they are in fact 'below par'. That they
get the job done is all that is relevant.

Oddly enough, you ignored a prime opportunity to show the value of
a Mac. There was a user in 'that other group' that you troll in that
was in some distress. It seems that he couldn't do a particular task
in the manner in which he desired. Oddly enough, you and your mac
apps were either unwilling or unable to come to the rescue.

So much for being 'above par'...

Some "clone" - requiring the "clone" maker to buy motherboards from Apple!
What's the difference, the case?

>Also, Apple's single processor is faster than both of the Be's processors.

But is pulled down to sluggish levels by Apple's clunky OS. Not to mention
all the type-11 errors.

>Apple has been releasing a lot of technical data lately and they are
>moving towards PPCP which does not make them closed. Bes right now run only

Question 1: Can I run Windoze on a Mac?
-
Question 2: Can I make my own OS on the Mac without having Apple release
any information to me?
-
Seems closed to me.

>moving towards PPCP which does not make them closed. Bes right now run only
>on propriety hardware (Be's own hardware, not PPCP), Apple's current

Wrong - Be adheres fully to the CHRP "standard" which Apple claimed to be
its future strategy for open computing. Then they trashed it to go with
"PPCP." Noone is yet making any PPCP boxes that can run MacOS. My bet is
that an interested entrepreneur could begin cloning BeBoxes tomorrow - Be
would be thrilled with the extra sales.
-
Be is far more open than Apple is. . . and "wait until tomorrow" sounds like
a litany of phrases I'd expect to hear at the Republicrat National Convention
(s), not from a computer maker near death.

That is an understatement. The whole point of the new binary group would
be to give it wider distribution. Very few of the ISPs in my area, and
none of the universities I've heard of accept alt.binary- anything.

I expect the new binary group to allow both 8-bit and ST stuff, although
I am only interested in the 8-bit.

Believe it or not, the basis of the Internet is /not/ Windozzzze systems.
Internet is built around Unix, and more than half of the Unix systems in
the Internet still don't run X or any other form of GUI; those systems
/require/ Lynx to browse the Web.

Netscape's claim is that 80% of the /graphical/ browsers in use are
Netscape. That's probably more-or-less an accurate claim. It doesn't take
the non-graphical-only access systems into consideration, however.

As for where I get the numbers - take a look at the domain listings at
Internic. Of the .edu and .ac.* domains listed, along with many freenets,
you'll find most of them don't offer GUIs at all.

Lowry, illuminate me: What Web server software runs on an Apple? I'd never dispute that the Mac excels in graphics applications (though I'd certainly take issue on the MIDI front - all the professional musicians I know personally prefer the Atari for MIDI), but I remain blissfully unaware of any server software for the Mac; it is difficult and expensive to interface to 100 Mbps networks because it requires proprietary interface cards and protocols (AppleTalk /is/ proprietary, you know). Thus most servers run under Unix, many under Novell, some under NT... I can't recall ever seeing one running under System 7.x at all.

In order for the RFD to stand any chance whatsoever of passing, a
comp.binaries group must be moderated. This is one of those unwritten laws
one hears so much about. <G> For those who prefer an unmoderated venue,
alt.binaries.atari has been newgrouped (several times) and, while
distribution is spotty, is available from many sites. I can personally
assure you that the moderation this time 'round will be responsive and
active.

The discussion group, while not strictly necessary, (of course, the
whole Internet is "not strictly necessary") will help to segregate the "why
didn't my cracked copy of Lemmings get posted?" from "who has a good
routine to read the system clock?" and thus relieve clutter in c.s.a.* (at
least, that's the plan).

As for ftp sites, all I can say is, "wait until next year."

Hmmm, as long as we still prohibit MOD files (which do have an appropriate venue for distirbution), I think we might consider Atari-specific files. Technically, the "chip music" files for both the 8-bit and ST series probably could be considered binaries in that they are obviously not graphics nor text, and they aren't useful on any other platform.

8-bit graphics files are so tiny (<=8K as I recall) that I don't have a problem with that, either. ST-resolution graphics would have to be pretty special to qualify, though; 32k isn't huge but it's big enough to be a nuisance if a lot of them are posted, and frankly, while I love the systems, I am underwhelmed with most of the graphics that have been produced for it. This is a case where I think http distribution does make more sense.

Kyle, your opinion, please?

>What's the difference, the case?

They don't require it. I believe that Umax makes and Radius made their
own.

>Question 1: Can I run Windoze on a Mac?

No but you can't run it on a Be either.

>Question 2: Can I make my own OS on the Mac without having Apple release
>any information to me?

If you mean any information that has yet to released then yes, you can.
The code for linux is, of course, free for all to look at if you
want a prototype.

>Seems closed to me.

Sure, whatever.

>Wrong - Be adheres fully to the CHRP "standard" which Apple claimed to be
>its future strategy for open computing. Then they trashed it to go with
>"PPCP." Noone is yet making any PPCP boxes that can run MacOS. My bet is
>that an interested entrepreneur could begin cloning BeBoxes tomorrow - Be
>would be thrilled with the extra sales.

No, they do not. They state this explicity on their web page. Their hope
was that the differences between CHRP (which was not finalized when
the Be released) and the Be hardware would be small enough that
CHRP OSes would run anyway.

(Maffia wants 8-bit sound and graphics files allowed in proposed
comp.sys.atari.binaries. Tietjens says maybe ok or something.)
I'm opposed to sound files and picture files, but really don't
care. I could see the binaries group get a bunch of tiny
picture and sound files. Hmmmm... I go to the midi binaries
group sometimes, it is a mish-mash of requests and binaries.
Sorta a prototype for the proposed atari. binaries. Except
Tietjens and Hofmann are looking for more 'discipline'
. Maffia wants to trade these rather rare formats of
sound and picture files. He probably has more of them
than anyone else, he's a rare bird that likes that type
of stuff. A simple post in csa8 might find out for him
if there's anybody else that likes the same type of
stuff. I like the original idea to exclude picture
and sound binaries, just have program files.

Nope, you are mixing up RAM Doubler and Syncronys' "SoftRAM" (the latter one is the fraud). RAM Doubler tries to reduce MacOS' wasting of expensive RAM. What Petey-boy advocates is software that gives you 24 megs when you _have_ 24 megs. He - of course - is accustomed to MacOS' behaviour to allocate a static amount of RAM for any started application and to chunk it until the whole machine is unusable, which goes like this:

Start Photoshop, then Quark and Illustrator, 32 megs used. The Finder won't open any further windows. Quit Photoshop (20 megs less used), the Finder won't open a window, quit Quark and Illustrator, the Finder won't open a window, reboot the Mac.

True, far superior to "other OS".

I was sloppy. I meant TOS.. Back in the early days of the Mac, users were not using mass storage and most were using the internal floppy for loading apps and saving data. Some used a second floppy for data saving. Over the years when apps were available in their fifth and or tenth update, HD became necessary and dropping in prices. Also the OS was being updated with new components and grew in size. Just because TOS has remain basically the same doesn't mean its better.

> Apple made a nice shell but, it's OS is still primitive and has yet

The ST was a bargain in its time. However, the world did no know(or cared?), the Tramiels failed to update in a timely fashion and Atari's inability to promote the message.

>>>> Despite being a relic, an ST can more completely take advantage of
>>>> its feature set than newer more powerful machines.

Probably true because TOS has not been updated to take advantage of new hardware.

>>>More Jabba speak. The OS doesn't do much. Were are the equivelant Mac/Windows

Currently I use WordPerfect. Will be using MS PowerPoint for projects in the comming months. I also use Netscape and begginning to use Cybordog which is tied to Live Objects.
>
> Our apps don't need Mac/Pentium class hardware to operate.
>
True. Using Old apps doesn't require new Hardware. My personal machine is a Quadra class PowerBook 520 and is fine for now. I may upgrade to the PB 190CS because of the 10' color screen for PowerPoint considering the price is only $977...

I hate to reign or burst the bubble...Currently shipping PowerMacs/Pentiums are shipping with more than enough resources to run apps and at a much lower price than a Falcon system to boot.

Thats interesting...I use MS Office and Netscape at the same time at work. I don't see any bogging dowm. However, I use a Powermac 7200/90 and Pentium 100. I don't know were you get this Mac Plus speeds..

Financialy wise Apple is in much better shape than Atari ever had been. Hard to believe that Atari showed up in any market share charts at all in NA. I suppose Canada was being milked but the U.S. was dismal.

However, Apple has rebounded back and the Mac clones are doing very well. I just hope that new Epic Powerbook will be a new chapter of stability.

I don't see the problem. Maybe it is different in Germany(?), So why did you
not buy an Apple monitor or a third party monitor that came with an adaptor?
You knew that Sony did not include the adaptor but you purchased anyways along
with the Mac. Why is it Apple's fault?

5527. Peter is a delusioned idiot

Newsgroup: comp.sys.atari.advocacy
Date: 1996-08-19 00:00:00 UTC
From: khaley@nova.gmi.edu
Message-ID: <khaley.840489102@gmi.edu>
Source record: 8636

Thought I'd just like to comment on Peter's spew about Apple's price/performance ratio and how cheap Macs are.

Yesterday I glanced through the latest CompUSA advertisement. 6 pages of PC ads, 1/3 of a page of Mac ads. Check out what system they had "for sale":

PowerMac 120mhz (I don't remember exact processor, though)
1.2 gig hard drive
4X CDROM
16 meg RAM
MacOS 7.5 (whoopee)
A couple of bundled apps/multimedia titles

Monitor sold separately. Keyboard sold separately. No modem.

Price: $2799.

Do you want some salt and pepper to go with that foot, Peter? No wonder Apple's marketshare is dropping faster than a rock! Any customer would choke at that price with limited extras (no keyboard, for cryin' out loud!!!) And no matter what you say, Peter, retail exposure makes 1st impressions. Not some obscure mail-order joint.

Read it and weep, Peter. This is the stuff being advertised at the retail level. No wonder Apple is in such bad shape.

Just thought I'd give you this little dose of reality, Pete. I know you can only handle it in teeny tiny doses, so you may not understand this one.

/Kevin

OK, I admit I'm a little bit interested. I mean, after all, Peter Sinclair-Day admits he has no recent experience with Atari computers, and to judge from what he knows of them, he has never owned one. Why, then, are the vast preponderence of his Usenet postings in the Atari newsgroups? He doesn't own an Amiga, either, as far as one can tell from his postings, but the Amigans are the next-largest "beneficiaries" of Peter's peculiar brand of wisdom. Here's a quick summary: Of a total of 1859 articles posted by sinclap between March 29, 1995 and this past Saturday (August 17, 1996), he has posted 1181 (that's almost 64 percent) in Atari newsgroups, and 364 (almost another 20 percent) in the Amiga groups. Only 140 messages - less than 8 percent - were posted in Mac-specific newsgroups. This adds up to over 80 percent of his Usenet time being devoted to attacking the users of other computers, rather than being spent joyfully in using the system he has chosen for himself? What drives a man to do such self-defeating things? Is he so unpopular that the other Mac users won't talk to him either?

I really dont' understand the mentality that says "I chose X brand, and you didn't, so you must be an idiot." If Nike paid me what they pay the pro athletes to wear their shoes, I might be inclined to go recruit other people to wear Nikes - but otherwise, brand loyalty simply for the sake of brand loyalty seems rather stupid to me. Certainly trying to convert people by insulting them (either directly, or insulting their intelligence with transparent lies) wouldn't be the path I would choose in that case, however.

I chose an Atari computer because I like the hardware/price/performance; I certainly don't much like what Jack Tramiel and family did either to the company or to the customers. If money were no object, and it were easy to change operating systems, I'd love to have a brand-new Mac; I'd like to have a nice shiny Amiga for the places where it excels, also (need I say "toaster" more than once?). I did have an Amiga for about 6 months, but at the time, I couldn't afford the upkeep on two systems, and I was running my BBS and writing software on the Atari, so the Amiga had to go. Those of us who are using Motorola-based computers have far more in common with each other than we do with Bill Gates and his legion of drones (although the chips themselves are perectly fine; installing MS-Windozzzze on any system is like hitching a thoroughbred to a hard-scrabble plow). So why would anyone waste all of his time (OK, only 80-plus perrcent of it) trying to irritate other users, instead of learning everything he could about /his/ system, so he could use it better? It's a puzzle.

Anyhow... Here's the Deja News user profile on our resident gadfly.

All of the above. Any Atari software is acceptable. If someone writes
a Jaguar or Lynx emulator, that would be accepted too, along with
titles. This is intended as a generic Atari software group, not as an
8bit or 16bit specific Atari binaries group.

>less price of the 7600/120. And these models were advertised in Best Buy and
>Office Max advertisement inserts..

Meaningless to the general consumer. When placed next to some $1600
Pentium system (WITH keyboard, WITH monitor, WITH apps, WITH modem)
the general consumer is going to choke at Apple's offerings. No wonder
marketshare is dropping.

>How convenient you leave out the other inserts..
>I agree that the 7600 was a bad choice to be advertised and listed in that way
>because it is more of a specialized model more appropriate for the video and
>multimedia niche marckets and did not list all features. Apple needs to pay

>more attention to this.

Exactly. They are pushing the wrong stuff on the general consumer.

>You only saw one retail chain.

Yeah, only the largest computer store chain in America. Others offerings
are just as bad if not worse... my local Best Buy has the Macs stuffed into
a small corner. My local Electronics Boutique has a bigger display
of Jaguar software than Macintosh software... and the Jag is dead!

> Like I stated above was a poor choice to
>advertise and Apple needs to be on the ball. However, I have seen plenty of

We should all agree not to respond to Peter Sinclair-Day's drivel any longer. This dude obviously has too much time to waste since he has posted over 1,800 posts in the last year.

If we ignore him, he'll go away and go to the mac.advocacy or windows.advocacy newsgroups where he belongs. Of course, he might not be able to take the heat since he doesn't argue in any logical sense of the word.

Regards,

Ben

: I completely agree. I remember having an extensive collection of Atari
: art and certainly would like to see all that be back in circulation.
: There were BBS's with literally hundreds of original art and musical
: items. Where are they now?

.mod files may be in some mod archive somewhere or floating out in
alt.binaries.sounds.mods. Other stuff may be lost. It's unfortunate,
but probably true. If we do eliminate the "software only" restriction,
then we would have a means of distributing these files (which are
platform specific, thus making comp.binaries.atari a good choice).

: Thanks for taking the time to create this Kyle. A few comments:

: Kyle R. Hofmann (rhofmann@crl.com) wrote:
: :
: : REQUEST FOR DISCUSSION (RFD)
: : moderated group comp.binaries.atari
: : unmoderated group comp.binaries.atari.discuss

: Is it possible to just use comp.sys.atari.st to discuss stuff in
: comp.binaries.atari? Why create comp.binaries.atari.discuss?

Yes, it's possible, but not everything posted in c.b.a will be ST
related. It's better to be more general in this case and to create a
.discuss group to handle all traffic concerning c.b.a.

: I know I won't go looking for something in c.b.a. unless I read about it in
: c.s.a.st as I don't intend to poke my nose in there if I can help it.

Hmm... It would possible to allow crossposting of part 0 of uuencoded
files to other comp.sys.atari groups (part 0 is traditionally a
text description, while parts 1 and up are the file itself). Is this a
good idea? It may not be, especially if we get a lot of postings to c.b.a.

: Also, does it have to be moderated? Seems like that was the cause of
: problems before.

Yes, it does. Nobody has tried to create a moderated comp.binaries
groups since comp.binaries.apple2 a long time ago, and that was changed
to moderated eventually. The proposal won't be accepted by the
news.announce.newgroups moderator if it isn't moderated.

: And then, of course, comes the issue of: do we really
: need this.

IMHO, yes.

: Right now I'd say we do, primarily because there is no satisfactory ftp
: site. I wish we could set up a really nice network of ftp sites (one
: in US, one in UK, one in Germany, France, etc...) that all mirrored the
: complete archive. U-Mich used to do this, but seems to have gone all
: rough around the edges.

That would probably be a very good thing, but that would still exclude
those who don't have FTP access. :(This way we can include them (as
long as they have Usenet access) and not worry about having to set up FTP
sites.

: >> moderated group comp.binaries.atari
: >(snip snip snip snip)
: >
: >Please modify the proposal to allow music and picture files specific
: >to the Atari 8-bit computer to be posted.

: Hmmm, as long as we still prohibit MOD files (which do have an appropriate
: venue for distirbution), I think we might consider Atari-specific files.
: Technically, the "chip music" files for both the 8-bit and ST series
: probably could be considered binaries in that they are obviously not
: graphics nor text, and they aren't useful on any other platform.

This is certainly an important issue. Chip music files don't have
anywhere to go (unless one newgroups alt.binaries.chip-specific :) and do
deserve some distribution. But see below.

: 8-bit graphics files are so tiny (<=8K as I recall) that I don't have a
: problem with that, either. ST-resolution graphics would have to be pretty
: special to qualify, though; 32k isn't huge but it's big enough to be a
: nuisance if a lot of them are posted, and frankly, while I love the
: systems, I am underwhelmed with most of the graphics that have been
: produced for it. This is a case where I think http distribution does make
: more sense.

I don't have a problem with 8 bit graphics files in terms of size, but
conceptually, I can't see a group meant for Atari binaries in general
excluding binaries for the ST simply because of their size. I don't
think it would be a problem, though, as 32k isn't all that big in
comparison to other things that are posted.

I recieved e-mail concerning an issue similar to this from someone
recently, but it was more general. The issue was: What kinds of data
files are to be accepted? If you think about it, it's important if you
plan to moderate the group much more than "no WaReZ".

To my knowledge, there isn't a proposal out there that has discussed
this issue much, mainly because all the comp.binaries groups that have
been proposed so far haven't tried to limit themselves much beyond what
platform they are for.

My response to this question is that we should probably post data files used in the operation of software. For example, if I draw a picture, it wouldn't be distributable on c.b.a because, after all, it's only a picture. If I create a character set for use with a word processor, though, then that would be distributable on c.b.a because it's used during the operation of the software. (I hope you're all not confused :) Does anyone else want to contribute? If you have a good idea, post it.

You mean Apple's other offerings as well which includes the Performa 6300 and
6400 line which they do have..

> Exactly. They are pushing the wrong stuff on the general consumer.

Apple is not pushing the wrong stuff on the consumer. CompUSA advertised a
model that is geared for ones who like to edit/create videos which this model is
geared. The added feature is a option on the Wintel side and cubersome to
install and too boot.
Most consumers would not need a 7600 and would settle for the complete
Performas..

The way that the 7600 was listed showed the perception that it was overpriced.
In my opinion the 7600/120 and 7600/132 are bit over priced. But than is a
popular model for Apple..

Amazing. A typical Sincrap response.

I'm really amazed by the fact that he didn't quote the entire post
to add his typical one line response.

Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other,alt.atari,comp.sys.atari.advocacy

Has anyone got a scanner for sale, or know where(in the UK) I can
obtain one fairly cheaply. I have just got STraight Fax 2.2 but need
to scan items to fax. (Max I can pay is 100UKP o.n.o)

Thanks to anyone in advance for you reply,

Regards,

James

Hey, you should see those ads in Germany. MacToday No. 5 advertises the
7200/90 PowerMac for 4,999 DM (1.48 US$ equal 1 DM) -> 3,377 US$. That is
for the 8/500/CD equipped machine, of course, but does include the 1705
monitor and keyboard.

A 6300 Performa costs 4,799 DM (12/1200/CD/TV/Vin/Modem) with 14" monitor
and keyboard. The 1705 monitor instead will cost further 799 DM.

The 630 Performa costs 2,499 DM (8/500/CD) with 14" monitor and keyboard.

Give me any Linux PC instead, they are _that_ much cheaper that a Mac just
doesn't compete against them.

5544. FS?? Falcon with 14 megs/NO HD

Newsgroup: comp.sys.atari.advocacy
Date: 1996-08-24 00:00:00 UTC
From: radiojon@polaristel.net
Message-ID: <4vntce$q99@cronkite.polaristel.net>
Source record: 8503

I'm debating getting rid of this Falcon 030 with 14 megs and NO hard drive. What are your offers? I asume about half of what Toad charges for a new one would be close to right.

I also have Cubase and WordPerfect, but that is a separate deal.

John

5545. I had to try it!

Newsgroup: comp.sys.atari.advocacy
Date: 1996-08-24 00:00:00 UTC
From: Mitch <just_ask@my.home.address>
Message-ID: <321FDB60.4655@my.home.address>
Source record: 8504

--
Sorry to post this to your newsgroup, but I had to try it!

I read this and thought, "What could I lose?"
Read through it and maybe you'll like to try it as well!
But please be honest. That is how it works.

"MAKE-MONEY-FAST"

----- Adapted article by Jody Vining (#4 below) ----------------

Want to make a few bucks? Quick, easy and cheap?

Ok ok, we have all heard this before, laughed at it, thought it was stupid, so did I. But one day, I was bored, and wanted to see if this thing really works, the now infamous newsgroup "make-money-fast" routine.
And well, to my surprise, it ACTUALLY WORKED. I didn't make $50,000 like some said, but I DID make $3,200 in 1 month. Thats not bad for a $5 investment!

So now try it, maybe you'll make less, maybe you'll make more, but its worth a shot right?

The procedure is very simple.

STEP 1. Write your name and address on 5 separate pieces of paper with the words "PLEASE ADD ME TO YOUR MAILING LIST". Fold a $1 note or money order or bank draft in each of the pieces of paper and mail them to the following five addresses:

---
1. Sahba Zadeh, 16115 122 Pl. NE, Bothell, WA 98011, USA

2. John England, 570 Vista Ave. Palo Alto, CA 94306, USA

3. Jeannette Bidegain, 2301 Redwood Street, #1406, Las Vegas, NV 89102,USA

4. Jody Vining, 987 Shetland Ave, Winter Springs, FL, 32708

5. Mitch Whiteley, 1026 N. 510 W. Apt. 4A, Logan, UT 84341

STEP 2. Now remove the 1st name on the list, move the other 4 names up (5 becomes 4, 4 becomes 3 etc) and put your name and address as number 5 on the list. You can do this by re-typing this article or simply editing and re-posting it in this or another newsgroup.

STEP 3. Post your amended article to at least 200 new groups (there are 17 000 of them).

You are now in the Mail Order Investment Business and you will start receiving $1 returns by mail within a week or two. The more newsgroups you post to, the bigger your return will be. You may want to rent a Post Office Box to handle the volume of mail you are likely to receive.

If you wish to remain anonymous, you can use a pseudonym such as "The Manager" or "The Investor", but make sure your address is correct!

NOW LET ME TELL YOU WHY THIS SYSTEM WORKS!

Of every 200 postings I made, I received an average of 5 replies, YES - ONLY 5, each with a $1 bill enclosed. You make $5 for every 200 postings WITH YOUR NAME AT NUMBER 5.

Each person who sent you $1, now also makes let's say,only 200 additional postings WITH YOUR NAME AT NUMBER 4, i.e. 1000 postings. On average therefore, 50 people will send you $1 with your name at number 4. You make $50.

Your 50 new agents make 200 posting each WITH YOUR NAME AT NUMBER 3 or 10 000 postings - average return 500 at $1 each is $500. They make 200 postings each WITH YOUR NAME AT NUMBER 2 = 100 000 postings = 5 000 returns at $1 each = $5 000.

Finally, 5 000 people make 200 postings each WITH YOUR NAME AT NUMBER 1 and you get a return of $50 000 before you name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE ONLY MAKES 200 POSTINGS! Total income in one cycle = $55 500.

From time to time, when your name is no longer on the list, you take the latest posting that is appearing in the newsgroups, SEND OUT ANOTHER $5 TO THE NAMES THAT ARE ON THE LIST, PUT YOUR NAME IN AT NUMBER 5 AND START POSTING AGAIN. Remember, 200 postings is only a guideline. The more you post, the greater the return.

Let's review the reasons why you should do this: THE ONLY COST FACTORS ARE 5 STAMPS, 5 ENVELOPES, AND 5 $1 BILLS. Anyone can afford five dollars to put into such an effortless investment with SPECTACULAR RETURNS.

Some people have said to me "What happens if the scheme is 'played out' and no one sends me any money"? Big deal! So you lose $5 - but what are the chances of that happening?

Do you realise how many Internet Users there are? Do you realise how many times this scheme can be utilised over and over again - with COMPLETELY NEW people participating?

There are not HUNDREDS, NOT EVEN THOUSANDS, BUT HUNDREDS OF THOUSANDS OF NEW INTERNET USERS EVERY MONTH!

Remember, read the instructions carefully and play FAIRLY...that's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroup postings to make sure everyone is playing fairly. You know where your name should be.

5546. Petey Boy - Whats a good Powerbook to emulate an Atari?

Newsgroup: comp.sys.atari.advocacy

Petey,

You could do something useful for once in your life and recommend a good Powerbook to me on which I can run MagicMac so that I have a portable Atari.

There are just so many availble new and second hand that the choice is confusing. Mainly I want at least 8mb RAM and 120Mb harddisk so that I can run some of the more powerful/demanding Atari applications.

A good display would also be a boon, though the price is an issue as I can;t afford the 2000UKP that Apple are asking for the 5300/100 8/500!!!!

Spencer.

That depends, John. Has the "clock patch" been applied? That's another
US$80 that will have to be expended (along with round-trip shipping to/from
Toad or someone) if C-Lab didn't make your Falcon.

Also, Toad's RAM prices seem to be behind the times. Their idea of a fair
price for 14M of RAM may be waaaay out of line...

...RAM prices have recently crashed.

>True...Like I stated before(which you conveniently deleted)it was poorly listed.
>However, CompUSA has the Performas espicialy the new attractive Performa 6400.

At 2800 bux, not impressive. Such machines only compete with the most
expensive faster pentia with double the RAM and double the disk and
other odd improvements over the 6400's standard hardware...

>Yes they have em because the Mac Jihads have saw them. When I was last there
>they has Performa 2320's which is costs less and includes Apple's 15' monitor.

The 6320 is relatively low end by now and still more expensive than even
an Aptiva, included monitor included...

...and the Aptiva has more disk, faster CD, etc...

Any other model at CompUSA (at least in these parts) is either a
scratch-n-dent or one-of-a-kind floor model closeout.

[JEDI deleted this]

>install and too boot.

Oddly enough NONE of the models featured by CompUSA had the advertised
capacity to edit video. One would expect such a high end feature to at

least be listed in the specs. I tried looking at apple, but they're webpage
is an ugly mess. No wonder you mac-n-twits think that you need a cray
for websurfing...

...btw, the 6320 (as opposed to 2320) come with a video CAPTURE
board. This is, in fact, distinct from a video EDITING board.
If you want to capture video stills, on a PC, (which is all
that even apple claims that the 6320 can do) all you need is
Snappy. Snappy just plugs into the parallel port with none of
those notoriously 'ugly' card installations.

Even the ST has Rombo. Someone might even come up with an ST
hack for Snappy.

Having a TV tuner feed to, what really is, a 13" monitor
is of limited value.

>Most consumers would not need a 7600 and would settle for the complete
>Performas..

Or much cheaper clones. 2400 bux is still quite a chunk of change.

They'll likely dominate their space with PC wares and yet
give more respect to an orphan games console than an 'allegedly'
'viable' computer platform (mac).

Ma and Pa Kettle cruising the mall will see a vibrant PC market
and Atari, which they thought went out of business long ago, and
yet no Mac presence. The Kettle's will keep this on their minds as
they go into CompUSA and see the PC's stretch across the length of
the store in back and see that the Macs are hidden in the corner...

Yet you will gloss over this.

You ARE in a different world.

Must be the high VAT tax added to it. Thats amazing.. This side of the Atlantic, the 7200/90 is no more.
I should find German partners to set up an export business to ship Macs to Germany to be resold for a tidy profit. However, my employer, Apple Computer would not take kindly to it.

What can I tell ya. The UK situation could be different than the U.S. Apple has cancelled the current PowerBook line for now. They will only ship the backlogs and the ones returned for repair.

The PowerBook 190 and 520 would be good candidates..

> At 2800 bux, not impressive. Such machines only compete with the most
> expensive faster pentia with double the RAM and double the disk and
> other odd improvements over the 6400's standard hardware...

The Performa 6400 includes a 2.4 gig HD, 16 MB HD, 200 MHZ processor and SRS sound woofer inside plus a shit load of software apps.. Also includes full PCI and 28k modem. I have seen that model discounted to about $2400-$2500.

True, I thought Apple could of done better with a lower price. Once demand is caught up, the price will fall when the 220 mhz one ships in November.

>
> The 6320 is relatively low end by now and still more expensive than even
> an Aptiva, included monitor included...
>
> ...and the Aptiva has more disk, faster CD, etc...

Very true. Apple is still probably selling a shit load of them anyways. Expect the 6320 to be no more soon with a 6340...

> Oddly enough NONE of the models featured by CompUSA had the advertised

Considering that the card is already installed..No mess nor fuss. Plus Apple has also the new Avid card for the new PCI Performas.

> Even the ST has Rombo. Someone might even come up with an ST
> hack for Snappy.

Don't hold your breath...No profit in it..

To you, not others. If it was for the ST and had an Atari label, would surely be different.

> 'viable' computer platform (mac).

Just because that store has Jagflop stuff doesn't mean its available at all stores. The local Software ECT has a nice Mac section, but I still buy almost all software from the big three mailorder because I save lots of money. Why should I pay $30 more for a game?

> Ma and Pa Kettle cruising the mall will see a vibrant PC market

Not at my local store. The salesdroid hated the Jag and Atari and not one was allowed in the store becuase it would still be sitting there ie, Jag 1.0!

So what are they replacing with or are they doing an Atari and pulling
out of the market???

>The PowerBook 190 and 520 would be good candidates..
Hmmm, people are asking over 1000UKP for a 520, you could buy a new
one for that!

Ok, thanks for the recommendation I shall go browse the glossies for
some better pricing.

To quote Twain........

Apple will be in business when you are gone. Apple has not stopped laptop
production. Apple has canceled the current laptop line to make room for the
new supposely in October. One department has ordered 200 Epics.
Apple's cash may be used to purchase Be..

The current PowerBooks have been a pain due to quality issues. However, they are not pulling out but readying a new line called Epic(which is suppose to be rock solid) by Oct-Nov. Epic will have a flip up keyboard, processor card, faster PPC, larger screen and internal CD-Rom... My school has put an order for 200 Epics..

Actually it is Apple that usually cant keep up with bells and whistles.
PC's though relatively mediocre in their system software, are much
more scaleable in functionality and price. One need not spend twice
the price.

>options..
>
>>>>>Different world here..

With the new Mac clones, the percieved price advantage that the Wintel world has had, has been smashed.. Apple is not the only Mac vendor in town. In two weeks, Motorola and SuperMac will have highpowered and inexpensive clones to boot. I for see that individuals can buy motherboards from Motorola to slap a system together to boot. Who knows, a Mac Shopper maybe concieved..

>>Interesting...
>
> Massive Mail Order offerings while potentially useful are not at all

It also limits me to whatever Apple thinks is good stereo equipment.
Apple will also quite likely charge you a premium for whatever they include.
Thus, if you want vicious sound (or gobs of RAM) you're better off adding it
to the system later.

Nevermind that I already have a computer->stereo setup already and have
had one for about... 8 years... and dont need another (overpriced) one.

R> You first. You have NO idea what you are talking about. NONE of you
R> pundits do, despite your pomposity.

Really? Somehow I fail to see how pomposity relates to knowing what constitutes theft and what does not. Let's try this: Assume I am running Ratsoft. Assume I have not bought it, but rather that I have cracked it. According to my definition, I have stolen it. According to yours, I'm "just trying it out" or some such mealy-mouthed phrase.

You call those who champion honesty "pompous," while maintaining multiple usernames (probably multiple accounts) at Ohio State University. Given your history, I wonder if you have even paid the low (partially-subsidized) fee for access to /one/ of those accounts, but that would be ad hominem, so let that go for the moment.

>> there with
R>
R> Yes, how DARE I stand up for the rights of someone for whom you
R> believe deserves NO rights.

Actually, as "JEDI" you've been in my killfile for weeks simply because neither you nor sinclap make a lot of sense on most issues, and rather than clutter up my hard drive with your particular brand of venom, I choose to let your discussions remain invisible. "JEDI" is an alias that was used to post for a very long time without a valid email address, as you well know, making it impossible to respond in email when that was appropriate. I found it easier to avoid the temptation to followup with inappropriate comments when I didn't see postings by "JEDI" at all.

As for standing up for someone's rights - you are conversing with someone who spent 23 years risking his tender pink body in the US Army so that young, unhousebroken puppies like yourself would be able to go to college without having to learn Russian or Chinese first. Strangely, I can't recall ever reading anything in the Constitution, nor in the Amendments to same, about "the right to steal the fruit of programmers' hard work and use it without paying for it." Perhaps you would care to enlighten the rest of us as to the exact location of that guarantee?

R> Yes, how DARE I state the folly of copy protection that has never
R> stopped any pirate I know of.

Actually, that is probably quite a revealing remark to those who are aware of your history as a pirate. It's not inaccurate, of course - locks (and copy protection) only keep honest people honest, and in most cases, are easily foiled. In point of fact, I make a practice of making copies of copy-protected software - for myself; so I don't have to buy a new copy (which might be hard to find) when the original wears out, and for anyone who did buy the original, which /has/ worn out. That, however, isn't piracy -the law calls it "fair use" as you well know.

R> Better that you hide your eyes, cover your ears and let the world
R> pass you by...

Perhaps. Or perhaps you are deliberately distorting my position so as to make yourself look (to the ignorant and naive) like an honest citizen.

>> - there's someone who openly espouses piracy. ...
R>
R> Under a very limited set of circumstances mind you. You conveniently
R> neglect that part. You moralists seldom live up to your own piousness.

I wouldn't call it "piousness," nor even "moralism," but slapping emotionally-charged labels on a position that one wishes to oppose is an excellent tactic - in politics and the courtroom. It isn't respected by /thinking/ people, however. You talk like a lawyer (that's intended as an insult) - willing to argue any position with equal venom, er, vigor, as long as there's a profit in it for you.

You back-peddle very well, by the way. Anyone who came into this conversation late and was unaware that Deja News allows them to read the entire thread would think you were being unreasonably attacked.

>> Ratsoft, too (might even be the guy who wrote it - now there's a product
>> that would be ironically deserving of being cracked).
R>
R> Guess who?

Thank you for confirming my suspicions about "JEDI" at least.

Followups redirected.

Typical cold war mentality to justify your 23 years on the gov't welfare dol...What a racket that you can retire after 20 years regardless of age to recieve a pension with free/subsidized medical care for life and as a nation we can't provide for our children. No sir, we would not need to learn Russian and Chinese unless you want to(my bro speakes the Chinese language). The whole cold war mentality was a farce....

>Really? Somehow I fail to see how pomposity relates to knowing what
>constitutes theft and what does not. Let's try this: Assume I am running

The operative word here is LAW. You talk about law, not THEFT, nor even
morality. You know nothing of the LAW. Yet you like to preach about it.

As always, I encourage EVERYONE to look into this for themselves. I also
suggest reading up on the Uniform Commerical Code as it applies to consumer
protection and software. You may find recourse for your own software gripes.

>Ratsoft. Assume I have not bought it, but rather that I have cracked it.
Actually, cracking it usually implies that you bought it.
It had to come from somewhere. It did not just magically
appear on those disks...
>According to my definition, I have stolen it. According to yours, I'm "just
>trying it out" or some such mealy-mouthed phrase.

You are breaking copyright, that is ALL. You are not yet committing any
crime: not even a misdemeanor. Check out the law and caselaw for yourself.
Any videotape has the relevant parts of the USC in it's little 'notice'.

If you discover that the program is complete trash, then you have
saved yourself the trouble of dealing with merchants that have no repect
for you and will LIE to you to attempt to keep you from knowing about, or
exercising your consumer rights. I refer to the now common disclaimer in
software stores stating that they cannot take returns on opened software
because of copyright law. This is a rather bogus lie. I also encourage
EVERYONE here to debunk this one for themselves as well.

If you find it usable and merchantable and then not yet buy it, than
you have broken the limited conditions under which I stated that unlicenced
software use is ethical.

Your objection is a non-sequitor red herring.

> >> (3) Mark is a pirate and assumed that everyone else is too. In this

Tee Posle Govno.

We don't need your brainwashed fascist asses to protect our liberties.
In fact, idiots like you threaten them. "...get back to the front..."

Merely being a mercenary is NOT standing up for ANYone's rights.

...and you are pompous. You assume much too much about me without
any reason. Then you use these assumptions to prop your own
miniscule ego up.

>reading anything in the Constitution, nor in the Amendments to same, about
>"the right to steal the fruit of programmers' hard work and use it without

As always, you 'moral' types need to LIE to make a point.
I never defended the pirate's right to pirate.
Since you admittedly never paid any attention to the post in

question, you have no real substantive things to say in the matter.

The man was accused of commerical copyright infringement. This is distinct from 'normal piracy'. This distinction is made by both the law and the pirates themselves.

If you stopped being pompous for a moment, and learned a little about those you want to blindly lash out at, you might gain some real understanding. You might actually come up with some decent arguements too. Although, I'd imagine that you would consider that futile. ALL you can do is blindly demonize. Like the original person I flamed, you seem to think that one 'immoral' act implies them all.

Sorry: the universe isn't that simple. If you'd spent less time being a Terminator for the state, you might be able to parse it [universe].

You can't stand the implication that there might be positive aspects of the scum you like to rag on so much.

This subject is not as binary as you'd like to think it is.

>paying for it." Perhaps you would care to enlighten the rest of us as to the
>exact location of that guarantee?

As always, the only way that you can make a point is to LIE.
Peter Sinclair-Day lies less than you do. Next to you, he seems positively sensible.

>
> R> Yes, how DARE I state the folly of copy protection that has never

Keeping honest people honest? Now THAT's an OXYMORON!
IF you were so morally superior, you wouldn't need the help!

>foiled. In point of fact, I make a practice of making copies of
>copy-protected software - for myself; so I don't have to buy a new copy
>(which might be hard to find) when the original wears out, and for anyone who
>did buy the original, which /has/ worn out. That, however, isn't piracy -the
>law calls it "fair use" as you well know.

Actually, there are specific provisions in the law for that sort of copying. However, for home users, such provisions are redundant until such time as non-comercial copyright infringement even becomes a misdemeanor.

You also neglected to mention that any Atari user who wants to make archival backups of their copy protected disks must take efforts to secure the software that does this. For the 'honest' user, this requires extra monetary expenditures in order to

'fairly use' their software.

Since such software is commonly available to the point that
even an 'honest' user such as your self has access to it
(after forking over more money) then: my original point
still stands.

This is one aspect of Atari-dom which is yet another hurdle.
This is one aspect of Atari-dom that the 'others' don't have
to put up with.

Suggestion to the bloke from Hawaii: if you can't do sequencing
without dongles on the Atari: DUMP IT, if you can. Consumers
only hurt themselves whenever they tolerate that which they can
avoid somewhere else in the marketplace.

A suggestion to Peter: suggest an alternative to a Falcon+Cubase
for the Mac. Try to come up with a usable solution for the lowest
possible cost. Don't necessarily recommend the newest most expensive
hardware if the task can be done in a satisfactory manner on the cheap.

This is the domain of _Power without the Price_ afterall...

>
> R> Better that you hide your eyes, cover your ears and let the world
> R> pass you by...
>
>Perhaps. Or perhaps you are deliberately distorting my position so as to

They are descriptive labels. They fit quite well, regardless
of any implications of bad rhetoric.

>/thinking/ people, however. You talk like a lawyer (that's intended as an
>insult) - willing to argue any position with equal venom, er, vigor, as long
>as there's a profit in it for you.

Your assertion is not consistent with the available evidence.

>
>You back-peddle very well, by the way. Anyone who came into this
>conversation late and was unaware that Deja News allows them to read the
>entire thread would think you were being unreasonably attacked.

Anyone with DejaNews could see that a pirate was accused
of activity that is not normally associated with pirates
solely because some SPA wannabe couldn't handle the possibility
of someone being a pirate and actually being a better software
customer [than an SPA wannabe].

If they would wish to discount my ideas solely becuase of
my political views, that is another matter.

Hopefully, they would be more honest to themselves and to others
about their biases.

Oxymoron of the week: Keeping Honest People Honest.

5573. RFI: Replacement for Atari Cubase Dongle-ware?

Newsgroup: comp.sys.atari.advocacy
Date: 1996-09-03 00:00:00 UTC
From: JEDI
Message-ID: <50i3re$mld@lex.zippo.com>
Source record: 8532
Cross-posted to: comp.sys.atari.advocacy,comp.sys.mac.advocacy,comp.os.ms-windows.advocacy,comp.sys.atari.st

This is a request for information. I am curious how one would go about replacing an Atari Falcon & Cubase sequencing setup.

There is a certain form of inconvenient, physical, copy protection that comes with Atari Cubase: a dongle. I was wondering if it would be possible to escape this 'inconvenience' by switching to another plaform (PC or Mac).

Most atarians seem content with their 'inconviences'. So, they do not go away (like they have on other platforms). So, the frustrated atarian has few options: Take it or Leave it.

I'd like to know what would be involved in the latter.

What would the minimal functional requirements be in hardware and software and how much would these cost?

5574. Re: Atarians: Assert your rights under the UCC!

<RFC Invalid> barked in COMP.SYS.ATARI.ST on 03 Sep 96:

I> Newsgroups: comp.sys.atari.advocacy,comp.sys.atari.st
I> References: <960901094319_100550.3170_EHK85-1@CompuServe.COM>
I> <555895772.26103.99.starship@3rdplanet.com>
I> From: Guess Who?

It's pretty damned easy to guess. Even Petey Boy probably figured it out.

I> We don't need your brainwashed fascist asses to protect our liberties.

Excellent. Glad to know you consider me a fascist. At least it explains some of your general attitude. Of course, I am absolutely sure you get up at 4:30 every morning and get home after a hard (physically - as in hot, sweaty, dirty labor) day's work at & PM (on a good night), make about 750f the going rate for people with similar technical qualifications in the civilian market, get to retire with lots of promises but damn near no actual follow-through (and BTW, you might tell Petey-Boy to do some research on that subject if the thought crosses your mind, he doesn't know squat on /that/ subject, either)... Well, anyhow.

I> In fact, idiots like you threaten them. "...get back to the front..."

Pardon me, but in case you haven't noticed, all of the US military is volunteers - and has been for over fifteen years. If you don't want to grow up, you don't have to. If you don't want to serve a little time in your country's service, you don't have to. You don't have to talk to me, either. Strangely, I doubt that either of us will suffer very much if you don't.

I> Merely being a mercenary is NOT standing up for ANYone's rights.

If I had been a mercenary, I wouldn't be still working for my bread and butter - mercs make LOTS of money. You claim to know a great deal about the law; you don't know shit about military matters, and that's a fact.

I> ...and you are pompous. You assume much too much about me without
I> any reason. Then you use these assumptions to prop your own
I> miniscule ego up.

I assume nothing that is not apparent from your posts. I might add that I don't recall calling you any names based on your politcal leanings (even if I knew them, they aren't germaine to this discussion - although I am pretty sure it was either you or sinclap who signed my yup to the marxist-leninist mailing list).

Perhaps I am pompous. I'm admittedly even a little arrogant. I have years of accomplishments that I can point to (which don't involve borrowing a

floppy from a friend and making an unlicensed copy of it), so perhaps I have some small reason to feel a sense of pride in what I have done.

>> reading anything in the Constitution, nor in the Amendments to same,
>> about "the right to steal the fruit of programmers' hard work and use it
>> without
I>
I> As always, you 'moral' types need to LIE to make a point.
I> I never defended the pirate's right to pirate.

I disagree. You must have a very short memory. Or perhaps we interpret what you have said differently. Are you now saying that piracy is unethical?

I> Since you admittedly never paid any attention to the post in
I> question, you have no real substantive things to say in the matter.

Your straw man is a deliberate non sequitur. /You/ say I didn't pay attention to the original post; I say I not only paid attention, I replied point-by-point with reasoned argument, ad nwas met with ad hominem attacks. Those tactics may work in the courtroom; they don't work with /thinking/ people.

I> The man was accused of commerical copyright infringement. This is
I> distinct from 'normal piracy'. This distinction is made by both the
I> law and the pirates themselves.

Define 'normal piracy,' then, if you will. I don't believe there /is/ a legal definition of 'normal piracy.' And, the man was not /accused/ of criminal copyright infringement; it was stated that he /might/ be a pirate, along with 2 other explicit possible explanations. /You/ seized on the piracy issue (as you do on a regular basis, EVERY time the subject comes up.) At this point, poor Mark probably wonders himself what he actually said; I can reprint it here, if necessary, but the gist of it was that he wanted to knwo where to find "cracked Atari software." He neglected to state in his first message that he owned a licensed Cubase copy and wanted a dongle-free version. I and others took offense when he posted private email in public (non-flaming, email, I might add - you can't obfusticate this issue). ONLY after it was said that asking for cracked software was asking for flames, did he clarify (or backpedal - it's a POV issue, after all).

I> If you stopped being pompous for a moment, and learned a little about
I> those you want to blindly lash out at, you might gain some real
I> understanding. You might actually come up with some decent arguements
I> too. Although, I'd imagine that you would consider that futile. ALL
I> you can do is blindly demonize. Like the original person I flamed, you
I> seem to think that one 'immoral' act implies them all.

Hardly - although in the Judeo-Christian culture, guilty of one /is/ guilty of all. Ask a Rabbi or Priest if you doubt that.

As for decent arguments, if you are studying law, which appears to be the case, I suggest that you have concentrated on finding emotional buttons to push and neglected rigorous logical argument. Here are several "decent"

arguments that you have conveniently ignored:

(1) If someone is incapable of cracking Cubase himself and really wants to run Cubase, he will either buy it, or not use it at all. Thus, there is a roughyl even chance (all other things being equal) that a pirated copy falling into his hands will result in a lost sale.

(2) Every cracked copy of copyrighted (and copy-protected) software in circulation eventually comes to the attention of the legitimate copyright holder. Given enough incidents of this type, an intelligent man who writes his programs for money (commercial or shareware) will leave the Atari platform and program for the PC, where even a piece of absolute crap is gauranteed sales of at least ten thousand copies if it has pretty pictures and good distribution.

I> Sorry: the universe isn't that simple. If you'd spent less time being
I> a Terminator for the state, you might be able to parse it [universe].

Universe: The totality of all things that exist. The cosmos. The world.

That includes me, you, my kids and grandkids, Bill Gates, and the concepts of "right" and "wrong," which seem to mean different things to you and to me.

And obviously you don't know shit about what I did in the military, other than get shot at.

I> You can't stand the implication that there might be positive aspects
I> of the scum you like to rag on so much.

No one - not even Adolf Hilter or Josef Stalin - is ever wholly evil or wholly good (and quote me no saints - their "goodness" is based on their adherence to a moral code that is predicated on fear, just as obeying the law is for most people). /You/ have insisted that I and the other proponents of supporting /legal/ copyrights are pompous moralists with a black-and-white view of the world. You are also perfectly well aware that we are no more or less narrow-minded that you are; but for the purposes of this discussion, you have chosen to make personal attacks because you know quite well that "piracy is the same as shareware" is not only specious, it's a silly position when analyzed rationally.

I> This subject is not as binary as you'd like to think it is.

Kindly show me where theft shades into legal ownership and I'll agree with you.

I> As always, the only way that you can make a point is to LIE.

You fail to point out the lie. Calling me a liar does not make it so; calling me Jane Fonda won't make me an actress, either.

I> Peter Sinclair-Day lies less than you do. Next to you, he seems
I> positively sensible.

Actually, Peter probably believes what he says; this does not qualify as lying, but simply ignorance (willful ignorance, I think, but there is a

difference between knowing the truth and denying it, and simply refusing to recognize it). That doesn't make him reasonable; nor does your comparing him to me make us similar.

>> Actually, that is probably quite a revealing remark to those who are
>> aware of your history as a pirate. It's not inaccurate, of course -
>> locks (and copy protection) only keep honest people honest, and in most
>> cases, are easily
I>
I> Keeping honest people honest? Now THAT's an OXYMORON!
I> IF you were so morally superior, you wouldn't need the help!

Moral superiority doesn't keep burglars out of an unlocked house. Any /idiot/ can recognize that fact. And people who are normally honest will often steal when they feel they stand no chance of being caught, and when they don't think the person or business they are stealign from will be hurt; that's been a long-established fact in psychology (readily available for you to look up in the University library, I'm sure). Your argument that "piracy doesn't hurt anyone" is rationalizing theft so you won't feel guilty. Rationalizing your culpability doesn't make it legal, and doesn't ameliorate the harm you do to software developers.

I> This is one aspect of Atari-dom which is yet another hurdle.
I> This is one aspect of Atari-dom that the 'others' don't have
I> to put up with.

There are very few commercial programs still in production for the Atari, as you well know; other than Cubase, I know of no other currently-porduced copy-protected software (that doesn't mean it doesn't exists, but that it's fairly obscure).

The copy protection on Cubase is a nuisance, yes; it's also reasonable, although the hardware solution they selected has faults as all such copy-protection always does. The fact that, every month or so, someone asks for a cracked copy of Cubaseshows that /their copy protection works./ Otherwise, no one would bother to ask. And you have repeatedly stated that copy protection only pretects the software from copying by the clueless; therefor, by your own arguments, most Cubase users are clueless. /I/ would say that they are more interested in music than in programming.

I> Suggestion to the bloke from Hawaii: if you can't do sequencing
I> without dongles on the Atari: DUMP IT, if you can. Consumers
I> only hurt themselves whenever they tolerate that which they can
I> avoid somewhere else in the marketplace.

That is actually good advice. Helping him select that software would be even better.

I> A suggestion to Peter: suggest an alternative to a Falcon+Cubase
I> for the Mac. Try to come up with a usable solution for the lowest
I> possible cost. Don't necessarily recommend the newest most expensive
I> hardware if the task can be done in a satisfactory manner on the cheap.

A note of caution here; Peter, seriously consider contacting the original fellow in email. Using a university account for commercial purposes violates the non-profit charter of the University and puts both that charter and your account in jeopardy. We have already seen you state that you sell Macs to supplement your income; your continuing advocacy of the Mac endangers your University when you post from that account. This is /not/ to be construed as a threat; it is simple fact (I won't act on it, if that gives you any comfort, but I can't speak for anyone else you have annoyed over the past 2 1/2 years).

>> Perhaps. Or perhaps you are deliberately distorting my position so as
>> to make yourself look (to the ignorant and naive) like an honest
>> citizen.
I>
I> What have I distorted? (patented VENOM)

Well, let's see, you've called me brainwashed, a fascist, a "Terminator" (considering that Arnie played both an "evil" and a "good" Terminator, I'm not sure that counts, but I am sure you intended it as an insult), an idiot, a liar, a hypocrite... Actually, you have portrayed me as somewhat less evil than Hitler, but no much less. Yet you call my statements that "pracy is theft" distortions? Strange.

I> On the other hand, I have pointed out your distortions.
I> That is what started this whole bit actually.

There's where we differ. You call them distortions. I call them facts. The dictionary here agress with me. It's Webster's New World Dictionary.

>> >> - there's someone who openly espouses piracy. ...
>> R>
>> R> Under a very limited set of circumstances mind you. You
>> R> conveniently neglect that part.

You neglected to define those circumstances at the time.

>> /thinking/ people, however. You talk like a lawyer (that's intended as
>> an insult) - willing to argue any position with equal venom, er, vigor,
>> as long as there's a profit in it for you.
I>
I> Your assertion is not consistent with the available evidence.

The "available evidence" is that you are Steve Hughey (that may be spelled incorrectly) who profits from commercial copyrighted software, "Ratsoft BBS," who maintained a piracy-oriented BBS for some time in the Los Angeles area, who was the cause of a respected citizen changing his telephone number for releif from your harrassing phone calls after he objected to your pirate activities... In short, Sir, you are a hypocrite of the first stripe, taking money for software and decrying others who wish to also profit from their programming.

>> You back-peddle very well, by the way. Anyone who came into this
>> conversation late and was unaware that Deja News allows them to read
>> the entire thread would think you were being unreasonably attacked.

I>
I> Anyone with DejaNews could see that a pirate was accused
I> of activity that is not normally associated with pirates
I> solely because some SPA wannabe couldn't handle the possibility
I> of someone being a pirate and actually being a better software
I> customer [than an SPA wannabe].

I am afraid that most people who can add and subtract are able to see that distributing software which has not been licensed is likely to result in loss of sales. How, pray tell, can causing lost sales make a "better software customer?"

I> If they would wish to discount my ideas solely becuase of
I> my political views, that is another matter.

No one even /knew/ your political views before you brought them into the discussion, certainly not at the beginning of the thread.

I> Hopefully, they would be more honest to themselves and to others
I> about their biases.

I have arrived at my current set of biases through experience, not by worshipping at the feet of some ivory-tower pseudo-Marxist. You haven't had the time to collect your own set of biases yet.

Switch to another platform. Start participating in the various Usenet newsgroups that pertain to that platform. You will be surprised how helpful they will be in getting you set up with the software and hardware that will fit your particular needs. It would help if you took a mild approach in replying to them whenever they do correspond. I am too old and lack the patience to offer any other good advice. Pointed (no-nonsense) suggestions are the most useful. Don't be bitter about things and spend your time dwelling on what system you should have spent your time and money on. Be flexible and happy. Get on with the good stuff. Turn that frown upside down! Good luck with your endeavors! Ciao!

JEDI wrote:
: This is a request for information. I am curious how one would
: go about replacing an Atari Falcon & Cubase sequencing setup.

First and foremost, you need to buy a few 'roundup' issues of Keyboard or Electronic Musician, where they might compare most current s/w available, price, etc. The Keyboard roundup was not more than a few months ago.

Steinberg has a nice upgrade/crossgrade policy--I think it's half price or something to that extent.

: There is a certain form of inconvenient, physical, copy protection
: that comes with Atari Cubase: a dongle. I was wondering if it would
: be possible to escape this 'inconvenience' by switching to another
: plaform (PC or Mac).

Got news for ya, puppy. I know for a fact that the PC progs have a dongle. Except since a PC doesn't have a cartridge port, they designed it for the parallel port, AFAIK. I believe that it's a pass-through (they have to let you hook up a printer, hm?). For evidence of wierd stuff with their dongle, do a DejaNews search (old and current archives in power search) on alt.steinberg.cubase for 'dongle' or 'parallel.'

I don't know about the Mac side, but the odds are that if they h/w protect a $600 prog on two platforms, well, most probably the Mac has some form of it as well.

You either should subscribe to alt.steinberg.cubase or get on the Cubase list (it's the same list) if you want to find out more from Steinberg and their users. Also, Steinberg reps and programmers answer questions and take a fairly active role.

: Most atarians seem content with their 'inconviences'. So, they do
: not go away (like they have on other platforms). So, the frustrated
: atarian has few options: Take it or Leave it.

Every now and then a post crops up on a.s.cubase about the dongle. It was met with the same gamut of responses that we have seen here on comp.sys.atari.st, though it's hard to say which ones were more acidic.

: What would the minimal functional requirements be in hardware and
: software and how much would these cost?

The rest of this post concerns mostly HD recording on multiple platforms. I wrote it before I looked back and saw that you just wanted a seqencer. Many sequencing programs are becoming audio integrated now, so it may

still be relevant. The references for further information, though, would still fit. Sorry for the misunderstanding, but hey! There's some audio info included gratis.

Without audio support, things get a lot cheaper that what follows below. I know that some people install Cubase on laptops with a parallel port or PCMCIA MIDI adaptor.

I can only write about what I know, as I don't have any reference in front of me. I shopped around for different platforms specifically for audio recording, and eventually chose the Atari Falcon, knowing full well that Cubase Audio may not be supported further.

Any DSP port hardware you have will not commute. There are a few digital interfaces out for the other platforms, allowing you to hook up and sync SMPTE to an ADAT or dump to a DAT.

Soundcards are a tricky business on the PC. Out of the thousands out there, you have to find one, review it, search for recommendations from people and/or Steinberg, and then hope it works with your particular PC compatible properly, together with drivers for Win 3.1 or 95. I don't believe Steinberg officially supports 95 just yet.

On the Mac, their audio programs seem to work well from what I've read, but one must be particularly careful as to which Mac you get, as the internal memory, speed and type of chip can and will determine the quality and # of tracks. The Mac has built-in sound.

There are extra MIDI ins and outs and other expanders for 'em and many other gadgets. Due to the sheer number of PCs and Macs out there, hardware and software abound.

The reason I chose the Falcon was because I wanted a device that could record more than 2 tracks simultaneously as well as keep the tracks that I do record separate and distinct. On the PC and MAC, the more popular devices are the Yamaha CBX-D3 ($1000) and CBX-D5 ($2000). They are self contained but expandable HD recording devices with 2 tracks in and four out. The D5 has effects and more DSP stuff built in.

(minor aside)
Do you really want to spend at least $2000 becuase you were insulted by a dongle?
(end minor aside)

Anyway, I can't give you a comparative h/w s/w cost because after I found what I liked, I stopped shopping. I thought about Macs really hard, as the nicer ones can do 24 track playback w/out additional h/w, compressed in the same manner as Cubase Audio Falcon 16 track mode. The nicer ones weren't cheap, though, even used. Shop around the .forsale or .marketplace and look up specs using FAQs and web searches.

I thought about PC's as well, but again, the issue of simultaneous multiple-track recording was and still is alien and cost-prohibitive. I

don't know the max tracks playback capacity. The sheer gigamass of s/w and competition though certainly drew me, and I felt competent enough to troubleshoot and install anything on any one of them beasties, but again with the cost. I would want at least a 133 P5, 16+ megs, big HD (or a small one installed and get a used one), and the PROPER sound/MIDI card. It's much more reliable to use a dedicated MIDI card to sync up the external HD or ADAT recorder.

Anyway, sorry I couldn't give you concrete everything. There's a lot out there, and not enough time to lurk through it all. I'd check with music stores, local studios, mail-order music shops, web pages, catalogs, magazines(!), and anything else I didn't think of.

Okay, Rich (nudge, nudge, wink, wink).

I'm not 100% sure what's going on here, but I've never seen Rich mask a post, and the address in this message (which I can't get the source of through Netscape, because I haven't learned enough to unhack posts) is _not_ the same one Rich normally uses. Grow up people, get a life, and quit wasting bandwidth on morons. Do _not_ reply! And will someone get this guy's account revoked if he's really faking his identity?

BTW, how do you set up a killfile on Netscape? I'm tired of manually marked posts from idiots as read.

Dan

Hmmm, I recently got a copy of Power Basic for my PC, I lurked in
comp.language.basic.misc for a while, well a week or two, took and
read about a thousand posts, including the faq,
I then asked a perfectly valid BASIC programming question, I got one
response, a most insulting mail stating that if i could not be botherd
to spell correctly or use a spell checker, then why should anyone else
bother to help me?, (my post was simple and understandable, but yes
spelt badley)
From my short sharp experience, I would say that the ONLY friendly
and helpfull platform that does not expect x amount of dollars for
helping is ATARI, I found that it is not just a tale spread by
ATARIans, we really are the most helpfull :)

I know on the Mac there are dongles too that connect to the serial port. These dongles do have a pass-thru, but I've read that they have the same problem as the Atari dongles (ie they come loose, they aren't recognized sometimes, etc.)

I've noticed that the German companies (Steinberg and Emagic) like using hardware dongles, while the US companies (Passport, MOTU, etc) like to use the key disk method.

Either way, you're going to have to bring something around.

IMO, I still would rather have the hardware keys because they don't wear out like key disks. My Notator dongle hasn't given me many problems, and I swap it often with my Spectre GCR cart too. (Remember, this is just MY opinion)

What, exactly, do you think makes his opinion less valuable or less valid
than yours? Tony cites an incident that convinced him of his views; you
simply state an opinion with no supporting evidence. Frankly, if one of
the two posts is pointless, I wouldn't choose Tony's as the pointless one.

Sounds like what I posted. Actually, I am not sure if users of other platforms (that read their Usenet groups) would be "surprisingly" helpful. Since Atarian's have always been very helpful, I just figured that others would be also. I have had an ST since early '85 and have always participated in users groups, platform specific BBS's and Usenet. I have never failed to get a quick and positive response from the Atari "group".

It has been a little demoralizing following this advocacy thread as there has been a lot of very negative baiting from "other platform" people. I always thought that the likes of Gary Kildale (GEM) and some of the excellent programmers at Atari (TOS) and the great programmers that wrote for the ST (SoftLogik's PageStream, Dr. T's Omega, and don't forget OID's!) really brought the PC into the moderm world. I am sure Microsoft and Apple drooled a little when the ST came out .. just guessing on that one! Oh well! There will never be another machine so well put together, tightly programmed and feature packed with what little it had inside. That is for sure! Adios!

>by a tax-free status. The University's access is paid for by taxes.

This is an obvious attempt to mislead the unknowing. All that is
required for a tax-free status is for the entity to be non-profit.
This makes a tax-free status , even for a university, no special
favor or subsidy.

Furthermore, depending upon my point of origin, it is quite likely
that my tuition pays for everything A STUDENT MAY CONSUME.

With an institution like OSU, THAT is a big distinction.

>
>By maintaining multiple accounts (if you, that is something you have left a
>bit muddled), you would be stealing from the people who pay to keep you in
>school.

That would be me; the taxpayer. That would be me; the tuition payer.

It's the use of hardware resources and network bandwidth that would
cost the university anything. You can't even manage to understand
that simple detail. Another entry in /etc/passwd and a few K on
the mail spool are relatively trivial.

That you percieve my actions to be 'muddled' shows that you are
completely out of your league in this area and should desist from
spreading your cluelessness to anyone else.

You sure do like to make ignorant accusations of theivery without
the slightest clue as to what you are talking about, don't you?

>
>And please don't try to tell me that your tuition covers all of the
>University's costs to keep you there. Anyone who has ever asked the admin
>staff what it costs to keep a student knows better.

If that is the case, I would not be surprised. It seems that OSU
has a knack for wasting money. With the exception of prestige there
is nothing that OSU can deliver that can not, and is not, delivered
for less cost elsewhere at other, private, institutions in this area.

You don't know squat about public universities in ohio.
You don't have any business spreading your disinformation
and poorly formed assumptions to anyone else.

> go about replacing an Atari Falcon & Cubase sequencing setup.
>
> What would the minimal functional requirements be in hardware and
> software and how much would these cost?

There are a couple of ways. The most important things to
compare are: Number of simultaneous recording tracks (Falcon
offers 8 with a $400 piece of external hardware), number
of playback tracks (Falcon offers 8 no compression, 16 with
2:1 compression), and number of outputs (Falcon offers 8
with $400 box), balanced or unbalanced ins/outs.

1. Run Pro Tools III and Cubase Audio on the mac. (if you have
Mac already, you'll pay around $5k for the hardware.

Adv: You'll get 16 uncompressed audio tracks playback with
this. Very reliable, easy 8 track simultaneous record,
quicker wavform redraws then the Falcon, sounds good,
good editing environment, solid audio sync, balanced,
TDM internal effects.
Dis: Hard to set up with Cubase Mac, EXPENSIVE, Cubase Mac
is a little buggier then CAF, MIDI timing is not rock solid.

There's also the cheaper Pro Tools Project setup for Mac or
PC, but your limit is only 8 tracks playback, it's difficult to
setup (this is around $2500 + computer).

2. Upcoming Korg PCI card with Cubase Audio on the mac (around
$1200 + computer when it makes it to market)

Adv: It will allow 8 track simultaneous recording, but ONLY
through and ADAT or ADAT a/d replacement converters. Otherwise,
only 2 tracks simultaneous recording (+ 2 more if you buy an
external A/D converter).
Dis: It doesn't exist yet. Unbalanced ins/outs. You must have
a ADAT to get 8 track recording. No software supports it yet
(although Deck II supposedly will when it comes out). MIDI
timing is still often an issue on the Mac. Card is in the
computer, so it's a little noiser.

3. Digidesign Audiomedia III for PC (around $700).

Adv: Cubase will eventually support it, probably
Dis: Doesn't work with Cubase Audio at all yet, because you can't play back recorded tracks while recording new tracks yet. Unbalanced inputs and outputs. 4 inputs and outputs maximum with addional hardware needed for 2 ins and outs. Card is in the computer, so it's a little noiser.

4. Yamaha CBX D-5 ($1500) and/or D-3 (800)

Adv: D-5 sounds great, built-in effects (OK quality), external unit.
Dis: Really tough to setup with Win95, D-3 is unbalanced with a high noise floor, some people can not get either to play back more then 2-3 tracks, SCSI 1 device.

There are other good external devices that can sync to a computer and sequencer, but that's not really integrated audio and MIDI, as you cannot move around the MIDI tracks on a computer screen, you have to setup tempo maps, etc.

Soundscape supposedly will be supported by some sequencers in the not too distant future. This is an attractive option for PC owners (4 track record/8 track playback, $3000).

There are a lot of stand alone sequencers that use sound cards on the PC to achieve up to 24 track playback, but you're limited to 2 tracks of input and output, making mixdown difficult (adding effects, eq, etc).

Anyway, that's my two cents..

> > software and how much would these cost?

If you want to get more of a response, you might consider posting
this message to comp.music.midi, alt.steinberg.cubase, or
rec.audio.pro (places where they probably know little of the
Falcon but much about other systems).

In rec.audio.pro, they pretty much laugh about the Falcon, because
they tend to be pros in the audio industry who use high end tools
costing many thousands, and don't integrate MIDI and digital
audio. Although there are people out there using the Falcon
in pro situations, I believe its forte' is in the home studio,
where its ease of use makes up for it's lower speed then the
super digital workstations like Pro Tools.. (I'd hate to have
expensive union talent waiting around and a client looking over
my shoulder while my Falcon takes a minute or so to draw a 5
minute stereo wave file). On the other hand, when (if?) a good
040 upgrade comes out that's compatible with CAF, look out..

-Mark

Hi,

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

This NGs is so quiet recently I thought I'd make a feeble attempt at generating some trafiic so there you have it-"Mac's are shit" or something.
One thing that does puzzle me a bit is how every movie I have seen this year had a Powerbook in it! They even had one in "Stealing Beauty", it's about some gorgeous bird (Liv Tyler!) going to tuscany and in a farmhouse in the middle of no where, no TV, no radio, these people only just have lights and theres a bloke playing on his Powerbook! Does this sort of stuff cost Aplle more than a fortune or what?

Why bother?

Why would anyone in their right mind want to buy a Power Mac now that
Power
Computing has pulled the rug out from under any machine Mac sells.

Buyer can specify configuration from factory
No more shitty Mac memory management
No more soldered caches
Economy models that are as fast as the BIG dollar Mac's

You need to get the lates Mac User from your library and do some
specification
reading and price checking.

Your a looser as usual SinPlop.

5,000 X 200 = 1,000,000. That means, in _every_ one of those 17,000
newsgroups you mentioned, about 59 postings will appear with this
chain letter in it.

Ask some friendly scientist (for example, a biologist) what he knows
about exponential growth. Maybe then you'll understand.

Regards,

Macs aren't shit. Macs are wonderful hardware for running MagiCMac,
MkLinux, and in a short while BeOS on. MacOS, on the other hand,
does under its still good shiny surface bear a certain resemblance
to things I flush in the toilet, yes. ;-)

: One thing that does puzzle me a bit is how every movie I have seen

: what?

Well, it's the same stuff with cars, I think. Wasn't there that Bond
movie a while ago where every luxury sedan was an Audi? That was
puzzling too, IMHO. And no, it's not every movie: in 'Twister' they
use ordinary x86 clone laptops for tornado analysis. To make this
a little more on topic: does anyone remember a movie where Ataris
were used or at least seen? I don't seem to... but there was one
Mac magazine that did use an Atari 1040ST for a cover photo that
should illustrate their 'from the first Mac to high tech' article.
Boy, did I laugh.

Yours,
Erik.

Even if they did work (and, as you say, they don't), they are chain letters which ask you to send money in the post; such letters are illegal in almost every country in the world (including Germany and the Netherlands).

>>> 3) Post the article to at least 200 newsgroups. There are 17,000, so
>>> it shouldn't be hard to find that many.
>
>OK, so far so good.

No, NOT so good. That's called "spamming" and it's not only rude (and a REAL good way to get mailbombed), it's a violation of the "terms of use" of every /respectable/ Internet Service Provider (including most educational institutions - anything with "edu", "ac", or "uni" in the domain name).

I spend an hour or so every day doing nothing but ferreting out spams and sending complaints to the spammers' postmasters. On an average day, three to five accounts are cancelled (without refund) because I complained about spammers. If even 10 percent of the people on the Internet would join me, you could figure on eliminating repeat spammers within a month. Newbies would continue to be clueless, of course...

Oh, and just to make sure this is on-topic - I do much of my spam-hunting from my Atari Mega STe. <G>

A Portfolio was used in Terminator (II?) to jimmy the teller machine. At
the teime, it was the only full-powered pocket computer running an "open"
OS (as opposed to the Radio Shack pocket computers, which couldn't run
anything not written specifically for/on them). Also, while it's not a movie,
the keyboard player on a late-night talk show (Arsenio Hall) used a STacy that
was clearly visible in most shots. And there was a movie some time ago that
featured an Atari 2600 (a game cart for the VCS was the pivotal plot device),
and showed a room practically full of 800XL systems.

Apple wouldn't have it anyother way that cool people use their products. As for cost, Apple co advertises the flick on tv with their PowerBook as the starring role.
Hopefully the new PowerBook 1400 will continue the honor.

Product availability. Seems that PowerComputing currently has a $50 million
backlog. My bro has ordered a Powerbase 180 and will not arrive until mid
October.

> Buyer can specify configuration from factory
> No more shitty Mac memory management

I would not go as far as that.

> No more soldered caches
> Economy models that are as fast as the BIG dollar Mac's

True. PowerComputing provides more bang for the buck only if they had any to
sell.

> You need to get the lates Mac User from your library and do some
> spe cification
> reading and price checking.

I have. I think MacWeek is better. From MacWeek, Motorola is getting into the
high volume Mac OS market on Sept. 17 with their new StarMax line. Excellent
systems and prices. The difference between Moto and Power is that Moto will
have a high volume in assemblyline in place and will over take Apple's unit
sales in 1998..

5606. Ethernet Ribel C90 card for TT need Help QUICKLY !!

Newsgroup: comp.sys.atari.advocacy
Date: 1996-09-14 00:00:00 UTC
From: herve@parx.frmug.fr.net
Message-ID: <GIONAGAFUP@parx.frmug.fr.net>
Source record: 8465
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.tech,fr.comp.sys.atari

Hi,

PLEASE - I NEED A QUICK ANSWER - I NEED REALLY QUICKLY TO MAKE THIS
CARD RUNNING !! ...

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030, in BNC ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?

Could you give me more informations about the jumpers because I have
no documentation of them !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Hervï¿½

>Sheesh....Does that include the VAT? Macs must be selling well...:)

Yup, that includes 15% VAT - it's illegal to advertise net prices to the
end consumer. And according to these "great" prices, Macs sell "well"
here.

>> A 6300 Performa costs 4,799 DM (12/1200/CD/TV/Vin/Modem) with 14" monitor
>> and keyboard. The 1705 monitor instead will cost further 799 DM.

Without VAT, it'd be ~4,200 DMs, still 1000 US$s more.

>> The 630 Performa costs 2,499 DM (8/500/CD) with 14" monitor and keyboard.
>
>Under a $1000 here if you can find one. Select Computers has a few..

And replacing the PSU will cost me the _how_ much? Remember that Apple
dealers are known to charge 549 DMs for an 8 meg SIMM for a 475 Performa
(this happened to a Hamburg Mac user in May 1996) or 634.24 DM plus 15%
VAT for replacing a 475's battery (this includes sending the 475 to an
authorized Apple service center).

It was just SinPlops terminology I was questioning. I
thought a know-it-all like him would know the difference :)

Sales tax over here :) Depending on which State you live,
in California it is about 8%. If you mail order outside
your state, usually no tax is collected. But with all the
Federal Tax structure built into business, you pay for it
one way or another.

Mike

5614. RIBEL C90 CARD HELP NEEDED !!!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1996-09-18 00:00:00 UTC
From: herve@parx.frmug.fr.net
Message-ID: <GISLDJAUUP@parx.frmug.fr.net>
Source record: 8473
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

5615. Discussion re JTS <> Atari merger...

Newsgroup: comp.sys.atari.advocacy
Date: 1996-09-20 00:00:00 UTC
From: blazek@uwindsor.ca
Message-ID: <Dy10Ay.9q8@news.uwindsor.ca>
Source record: 8474

Since this is atari advocacy I thought it best to post here.
A school buddy of mine, and a long time Atari shareholder,
received a copy of the JTS-Atari merger documentation (sent out
to all Atari shareholders presumably).

Its a long document 100+ pages and since I don't have OCR I can
at most quote only limited amounts. Is there any interest in
people having questions/comments on the merger posting here and
me consulting this document in answer?

In the interests of openness I'll only entertain public requests,
private emails will be politely turned back. I'd like to avoid
rancor and will only accept discussion based on the information
contained within the document. I can't otherwise speculate on
the information presented, as I'm at most a peripheral observer
of the Atari scene.

It might be possible for me to OCR this document in the future and
post either here or on my web site. Before doing so I'd need
strong confirmation that such a move on my part is not illegal
or subject to attack by JTS, Atari or their agents. It may
be that this info is already net available at an official (eg. SEC)
site or at an Atarian location. I invite others to see if that
is the case, as my time is limited in this matter.

Finally I stress that my offer is informational only and not an
attempt to stir up Atari vs. every-other-system-on-the-planet wars.
I expect a modicum of politeness; blatent and/or nasty and/or
self-preening advocacy may force me to withdraw my offer.
I very rarely get involved in flame wars (if at all) and don't
wish to start now.

Yours,

RSB

HEADLINE: Motorola Computer Group Introduces New PowerPC-Based, Mac OS-Compatible Systems; StarMax Systems Carry an Unprecedented Five-Year Warranty
Emphasizing Motorola's Commitment to Quality

DATELINE: TEMPE, Ariz.

BODY:
Sept. 17, 1996--Motorola Computer Group (MCG) today revealed its new StarMax family of PowerPC-based, Mac OS compatible systems.

Utilizing high-performance PowerPC 603e and 604e microprocessors, the StarMax systems offer a strong price/performance advantage, multimedia-rich
"It is our goal at MCG to expand the Macintosh marketplace internationally,"
stated Joe Guglielmi, Motorola Computer Group corporate vice president and general manager. "We know there is a demand for high-performance, quality systems; customers can feel confident that the StarMax systems they purchase meet the impeccable Motorola standards of quality."

While traditional computer vendors typically offer a limited one-year system
warranty, Motorola's StarMax line carries an exceptional five-year warranty, the
most comprehensive warranty plan in the computer industry. The first year of this warranty provides for on-site repair, followed by a two-year return to an authorized depot and two-year return to factory. In addition, there is 90-day out-of-box telephone support and optional service and support upgrades.

In February, MCG announced its broad licensing agreement with Apple Computer Inc. This agreement allows Motorola to sell, support and service Mac
OS (versions System 7.5.x and the next major Mac OS release), PowerPC platform desktop systems under the Motorola brand name. As Apple's first licensee granted sublicensing rights, Motorola may also sublicense Mac OS motherboards and private label systems to the OEM marketplace.

"Apple and Motorola have forged a close relationship under the AIM alliance,
meet the impeccable Motorola standards of quality."
hardware design used in the new StarMax systems," commented George Scalise, executive vice president and chief administrative officer for Apple. "We look forward to Motorola's StarMax systems entering the Mac marketplace both within the U.S. and abroad and are very pleased Motorola has joined the ranks as a Macintosh compatible provider."

In the enterprise market, the StarMax line complements MCG's new family of Windows NT and AIX servers, also announced today. Together, they provide an outstanding client/server solution in application markets such as workgroup computing, Internet/intranet, publishing and multimedia.

Key StarMax Product Features The StarMax design takes advantage of the broad array of industry-standard PC peripherals including monitors, keyboards/mice, floppy disk drives, CD-ROMs, hard disk drives and chassis. This unique capability is available on both the StarMax 3000 and StarMax 4000 product lines.

The StarMax family consists of an entry level 3000 series and high-performance 4000 series. Both series offer a choice of desktop and minitower configurations and will be available worldwide. The 3000 series uses the robust 603e microprocessor and includes the 3000/160 and 3000/200 in desktop
and mini-tower form factors. These desktops have 256K level 2 cache as the Macintosh compatible provider."
ADB, PS/2 keyboard/mouse support and 3 PCI slots.

These features allow the user greater flexibility of choice between Apple and PC peripherals, which may provide investment protection for existing assets.
The minitowers offer standard 256K level 2 cache, impressive 32 MB standard memory (expandable), 2.5 GB internal storage and 5 PCI slots. All configurations in the 3000 series include a Motorola 28.8 data/fax modem as well
as a software bundle which includes Internet connectivity, office productivity and financial applications, system utilities and additional CD titles valued over $ 1,000 retail.

The 4000 series incorporates the high-performance 604e microprocessor and includes the 4000/160 and 4000/200 in desktop and mini-tower configurations. The desktops have standard 512K level 2 cache, 2 MB video EDO DRAM (up to 4 MB),
16 MB memory standard (expandable), 1.2 GB internal storage and 3 PCI slots. The mini-towers offer standard 512K level 2 cache, 2 MB video EDO DRAM (up to 4 MB), 32 MB standard memory (expandable), 2.5 GB internal storage and 5 PCI slots.

All StarMax 3000 and 4000 systems come equipped with multimedia features including a 8x CD-ROM with 16-bit stereo sound in addition to a keyboard and
The minitowers offer standard 256K level 2 cache, impressive 32 MB standard
Pricing and Availability Systems will be available to the enterprise, small/medium business and small office/home office (SOHO) markets through an extensive network of distribution partners. In China, Nanjing Power Computer LTD, a joint venture company owned by Motorola International Development Corporation and Nanjing Panda Electronics Company, will assemble and distribute Mac OS-based desktop systems for the enterprise, government and education markets.

As announced yesterday, Mitsubishi will be the leading distributor of MCG systems in Japan. Motorola estimates that prices will range from $ 1,595-2,395

for the StarMax 3000 and $ 2,395-3,595 for the StarMax 4000 series. Availability is expected within 45 days in the United States and late 1996 internationally.

About Motorola The Motorola Computer Group is a worldwide hardware and software platform supplier to companies that provide computer solutions. MCG is comprised of three areas of focus: embedded technologies, technical OEM systems and commercial systems. MCG's strategy is to deliver high-performance PowerPC platforms and solutions for Mac OS, Windows NT and AIX operating systems for targeted areas such as graphics-intensive applications, multimedia and the LTD, a joint venture company owned by Motorola International Development MCG corporate headquarters, along with regional headquarters for Latin America, are located in Tempe, Ariz. Regional European headquarters are located
in Maidenhead, United Kingdom and Hamburg, Germany. European channel headquarters are located in Paris, France. Headquarters for MCG's Asia Pacific region are located in Hong Kong. Information about MCG's products is available on the World Wide Web at the location http://www.mot.com/computer.

Motorola Inc. (NYSE:MOT) is one of the world's leading providers of wireless
communications, semiconductors and advanced electronic systems, components and services.

Major equipment businesses include cellular telephone, two-way radio, paging
and data communications, personal communications, automotive, defense and space electronics and computers. Motorola semiconductors power communication devices,
computers and millions of other products. Motorola's 1995 sales were $ 27 billion. -0-

Wait until you try to purchase some property. Iowa's property
tax is sky-high. Then, in the smaller communitys, there are
assessments on top of assessments. There are of course reasons
for this, but all states must support their unemployed somehow.

This posting begs the obvious questions first: why are you getting Atari
listings, Mr. Sinclair? <smile>

Funny, I just read a notice from Toad (posted on here) about their annual
holiday fest being moved up to October (26th, I believe) and about all the
new hardware/software that was going to be shown as well as specials and
deals on used stuff...

I talked to Jennifer not long ago and she said that they (Toad) were
actually doing more Atari business now than ever...When I asked her
if she thought they would be doing Atari stuff 2 or 3 years from now,
her answer was "I think we'll always be doing something Atari-wise".

Oh, one more thing Mr. Sinclari...was that Pentium stuff advertised in
the same breath with its ability to use MagiC-PC/Gemulator/Linux/etc,..

Hmm? Well, was it? Thank you...

5626. Atari games for trade - Please READ!

Newsgroup: comp.sys.atari.advocacy
Date: 1996-09-23 00:00:00 UTC
From: thehidden@ludens.elte.hu
Message-ID: <1996Sep23.110145.31569@ludens>
Source record: 8485

Hello Atarilovers,

Perhaps you haven't read any letters like this for years, and Atari ST is now out of fashion. So, I'm speaking to that few people who are mad of this kickass computer. I would like to trade with ATARI ST games (I have about 200 of them...) via internet, e-mail, snail-mail or what. I'm also interested in STe and Falcon 030 games. Please let me know if you're interested. My e-mail address is thehidden@ludens.elte.hu (Yeah, you're right, I'm hungarian!!!), but if you reply to the actual atari newsgroup, that's all right too.

If you reply, I send you my list. And one important thing: I'd like to do this without sending money or asking for some bucks...

Cheers,

The Hidden (aka Sebi)

(P.s.> Mark Love, if you read this message, please contact meeeeeeeee!!!)

Are you serious? The clones are affordable considering what you get. Don't
compare any antiquated 030 and 040 overpriced ST and Falcon clones to a 160 mhz
box - considered lowend...

You also need quite a bit more Mac (of any kind) just to load
the OS. It brings up those nasty little issues you always
refuse to address: real thruput & real power.

Atari's can be quite usable running only in the resources that
Macs (or PC's) waste.

Actually, I am very pleasantly surprised. This, combined with the SunApple
alliance (to counter NT server) is giving Apple a fighting chance it lacked
just two months ago.

So what you are stating is that a PPC 603e 160 mhz is not as good as a 16 mhz
68030? So what are the other indicators? Considering the price includes a 28k
modem and at least 1.2 gigs....

Whats a quite bit more Mac are you referring to? So what you are stating is that a $1600 160 mhz Powermac is not capable or enough for the entry level users? Considering that it includes a 28k modem? Considering that this pup blows away the $3000+ Hades....

> Atari's can be quite usable running only in the resources that

Interesting.. The apps that came with my lowend PowerMac runs great.. 1980's ST and 1980's ST apps still run...If progress is not a concern thats okay...However you are out of luck with 1996 APPS such as web browsers and lots of CD multimedia apps.

The modem is rather peripheral.
Considering that Apple and Microsoft do their best to squander whatever
computing resources are available, it would not be at all surprising if
that 'entry level' machine won't keep up (or wont keep up 6 months from
now).

>blows away the $3000+ Hades....

GEM doesn't need that much machine. MacOS does.

...just how much time do you spend running multimedia toys?

Browsers, even beyond CAB, can be had for those with the interest.

Progress in one area does not indicate progress in any other. In fact,
regression could occur in all others and your 'media hype marketing'
philosophy would not notice it. Regression in the others can nullify
what apparent progress has been made.

I'd love to see Apple release System and Finder for the PC - if it can maintain the ability to use DOS 8.3 filenames, and read Win95 long filenames, it HAS to be better than M$ crap. A little competition would be healthy in the PC OS market, and only Apple is in a position to do any such thing.

Sorry, 1996 APPS such as CAB and various TOS based multimedia APPS work
just fine on my 1987 Mega and are outstanding on my 1993 Falcon... :)

Oh, BTW, I know what the MIPS rating for an '060 Hades is; but I don't
know what it is for the 160mhz Apple you were referring too...Can you
please be so kind as to enlighten us? Thanks...(but still keep in mind
that it takes a lot less "grunt" to effectively power the Atari (TOS)
environment as compared to other platforms--yes, even system 7.xx) :)

[sigh] You'll get them every time. Why they do it, is beyond me, when many
of these cancels have no rhyme or reason, just random. I recognized a part
of the Path header as coming from a bot called Dave The Resurrector, run
by Chris Lewis in the news.admin.net-abuse.misc newsgroup. He's not the
canceller, rather, he and his bot is the one that reposted those that were
cancelled. Who the canceller was, I don't know. You'll have to ask him.

5647. Future of Atari binaries groups

Newsgroup: comp.sys.atari.advocacy
Date: 1996-09-27 00:00:00 UTC
From: atari@teleport.com
Message-ID: <52h75b$7ht@ornews.intel.com>
Source record: 8406
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.atari.st.tech

For those of you who follow such things:

A formal propoasl to establish (or reestablish) comp.binaries.atari has been submitted to the appropriate net.gods - it has been over 3 weeks since submission, in fact, but the RFD has not yet appeared in news.groups nor in news.announce.newgroups (the "official" venues for such discussions).

It is suspected, based on comments made in those groups, that there is deliberate foot-dragging going on vis-a-vis any RFD to establish any binaries newsgroup.

Anyone interested in participating in the newsgroup creation process is invited to subscribe to news.groups (but I'd suggest you have your killfile ready - there are any number of totally irrelevant postings in there most of the time).

Seems that Microsoft can get any number of newsgroups made in the comp and
binary areas! I had to tell TIN I didn't want to subscribe to a whole lot
of them, took a while to get thru!

The Hades is not that much more expensive here. I won't buy one, though,
for a clone PC comes much cheaper than both Hades and PowerMac.

Hi,

I need very very QUICK help for an Ethernet card called RIBEL C90.
=====
There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

The modem adds value.. My 75mhz PowerMac keeps up nicely for what I use it
for. Considering this model first appeared in '95'.... You assume to much
Jabba. There always will be something faster and cheaper in six months or
sooner. It's called progress but ST users do not have that choice..
>>blows away the $3000+ Hades....
>
> GEM doesn't need that much machine. MacOS does.

GEM doesn't do much in features and functionality..

The answer's easy...Billionare Bill can get any newsgroup he wants on the
Net including one with GIF pictures of his wedding photo. Meanwhile, the
people(those who actually work for a living and buy and use products) are
basicallly told to go stick it, especially on a non-Micro$lop platform which
alone is basis for charge of heresy by the 'mainstream' computer industry.

Wow, you think a $200 ST with $50 modem and CAB can get even lower-class
people access to information on the Internet. But I guess it's reserve
to those at least middle-class who can afford the most recent expensive
setup.

Sorry for the ranting, but I just read an interview of William Gibson who
talked about the same thing. Since he coined the phrase "cyberspace",
then he outta know a few things. :)

Thumbing his nose at Internet ellitism is the computer shock-jock...

How can that be? Last I checked you can't even get a 603e 240mhz AV
model as of yet.
I tried to place an order through work and was put on a waiting
list.....
These machines, in this configuration, simply were not available as of
yet.
Interesting to note that most Mac rags had them advertised however. Talk
about
Microsoft bullshit. Call me, maybe if your dumb enough you'll give me
your credit
card number to hold for a few months.....
So are you saying that all of Europe will be forced to purchase a
machine that
cost over $3000.00 U.S. dollars? I think you may be missing a market.
One that
you fit into. If the 604e's are so bitchen running at 200mhz why didn't
you buy
one?
Don't bother to answer that, I think we all know the answer.

Mike

Hades is more computer, it is faster at getting tasks done than Pentium Pro. We have run numerous tests and timed them, it boots, it loads, it performs functions faster than any desktop computer.

It is a jaw dropping experience. Especially when you consider that it is using "so called" ancient technology like a 68060.

All the best,
Chris

yep..You can't get a PowerBase 240. However, Power is supposely shipping down
the que this week. The powerbase is backordered to December. Some $50 million
accordingly. Power jumped the gun by announcing at MacWorld and not having the
product to sell. However, the other clone makers will jump in the market with
fast ones...

Why I did not buy a 604e box was due to financial reasons.. I found the $900
Powermac Performa would serve my needs for now than comming up with $2000 for a
fast 604 box. In six months time the 604 box should be going for half the
$2000 or a fast 603e box.

it's called progress is it? Can computers now type faster than I can think?
It's not called progress it's called capitalism. it's making money from
people. selling them dreams and hype and an emotional connection to
reality, which some people need.
>GEM doesn't do much in features and functionality..
Wha...?!
GEM functions quite nicely.
example: a floppy disk icon is on my desktop, I want to open it, I double
click on it, it opens - WOW! awesome!
as for features I have a wide choice of features such as desktops: Gemini,
NeoDesk, Ease, etc. I have a choice of multitasking systems Geneva, MultiTOS,
MagiC, Linux(Falcon/TT only)
>Sure can running old software like Mac plus users can find their machines
>useful as a fish tank..
a feeble put down based on your perceived emotional reality. If software does
what I want it to do, I'm happy. If it doesn't I'm unhappy -
regardless of the system I am running OS/2, Mac, TOS, Windoze,
DOS, etc. The _age_ of software is irrelevant to the ability
of the software to help me to do what I want. The _age_ of the
software is only relevant to those people who make a living
programming software, and who would like to keep food on the
table,. The Atari market is one of the few where I have a
pretty good idea that my $ is going right to the programmer,
and not some slave lord like Bill Gates.
>You mean multimedia tools.. Multimedia tech is becomming more integrated in
>the apps that you run today like the plugin tools for netscape and so on.
>Becomes transparent to the user..
No. Not Multimedia tools. They are not "tools" they are games. they are toys,
they are shiny bits of glitz, they are 'selling features' they are
diversions and distractions from the business of living. They are
"amusements", they are fun.
>Try running a quicktime video and real audio with CAB...
yeh? why would I want to run a quicktime video, with or without audio?

no, they dont mean 'a canceller which cancels messages by rogues'. ;)

Someone has maliciously been cancelling valid messages, and some sys.admin type as been automatically re-posting articles which should not have been cancelled. Unfortunately, some of us had read the cancelled messages before they were cancelled...

>The modem adds value.. My 75mhz PowerMac keeps up nicely for what I use it

So fucking what. It's a $100 component that can be had ANYWHERE if
you use a standard serial interface (like everyone except apple).
In this repect, even CompUSA still stocks walls full of Atari hardware.
It adds TRIVIAL value.

>for. Considering this model first appeared in '95'.... You assume to much
>Jabba. There always will be something faster and cheaper in six months or
>sooner. It's called progress but ST users do not have that choice..

If that 75Mhz machine were so nifty then what really would be the
utility in 160Mhz, 200Mhz or 240Mhz machines? They would just be
a lot of wasted cpu cycles.

Either the faster machines possess no real utility, or the older
slower machine has now been made a dog.

You really can't have it both ways.

>>>blows away the $3000+ Hades....

>GEM doesn't do much in features and functionality..

Actually, MacOS doesn't really deliver anything more substantial
than GEM does. Sure it bundles quite a few application level
toys and tries to call them part of the OS but, that's something
else entirely.

It's a no frills GUI.

5667. when, and where, was this st1040 built?

Newsgroup: comp.sys.atari.advocacy
Date: 1996-09-30 00:00:00 UTC
From: boris@berlin.snafu.de
Message-ID: <52p3qr$2lh@unlisys.unlisys.net>
Source record: 8426

I have a question about the Atari ST1040 computer which I couldn't find answered in the usual litterature. I hope someone here is able to help me.

I am working for the Heinz Nixdorf MuseumsForum, a computer museum wich is in the making in Paderborn, Germany. The HNF will open its doors on October 24th, and will then be the largest computer museum internationally.

I am curating, among others, a permanent exhibition titled "PC Hall of Fame". We'll exhibit the Atari ST1040 there, which leads me to my question.

The object description cards have to include information about the producer and the year and location of the production. Though the producer part isn't that difficult, and I know the production period of the entire product line, I don't know where they were assembled.

Is there a way to tell this from the serial number?

Any help appreciated. TIA,

Boris.

How do you know? When was the last time you used it? How about Magic
(very windows
95 like)? How about Geneva? How about Linux? How about SMS2? All very
usable and
functional and (with the exception of GEM) all being constantly updated.

Hear hear!! Never a more true word spoken!

The Motorola 680x0 line has always been more advanced than the 80x86 line.
The efficiency of the 680x0 was and always will be superior to the 80x86
too. In the case of the '060 this is even further proven because it takes
a Pentium running at high clock speeds (120-133MHz) to match the MIPS
rating of the 66MHz '060. But then I shouldn't be comparing MIPS because
MIPS has little to do with true computing power. You also have to consider
that the 'high powered' Pentium has to also run a kludge of an OS (namely
Whinge95). Run MagiC 5 on your Atari clone and you'll see much much better
performance than your PC will deliver...

Of course you would take this attitude with a Mac. In this respect, Mac's
have less support than even the orphaned Atari's and Commodores.
You don't have any real retail options when it comes to modems, whereas
we can just walk in and find aisles of them awaiting us. We can pick and
choose as our needs dictate.

We don't need options forced upon us because of pathetically poor
retail support.

>Typical Jabba.. We don't have it but others do and it's wasted bandwith.. Now

I have access to a T1 connection. I still consider it wasted bandwidth.
On anything else, one will just get bored with insufficient thruput after
a time.

I have seen the so called 'promised land' and I am here to tell all of the
other Atarians that it is nearly completely hype. They're not really missing
anything with CAB or even Lynx.

>its like stating all those Sports Utilities just waste gas and risk lives in
>the Middle East..

A truck-class vehicle can actually deliver quantifiable gains.
You have yet to sufficiently quantify the gains of your so called 'progress'.

BTW-most sport utility vehicles are just rehashes of 50 year old designs.

You couldn't spot real progress if it came up and bit you on the nose...

>Verifiable proof is available where?

In the microprocessor manuals.

pipelining: 030 vs 486
L1 cache: 030 vs. 486
32bit registers: 68000 vs. 386
16bit external bus: 68000 vs. 286
Flat addressing: 68000 vs. 386
16M address space: 68000 vs. 286
64G address space: 020 vs. 386
Historically better FPU performance.

Those are just the less philosophical nits.

[deletia]

>NT.)

At which point you are nearly in the same condition wrt support as you are
on an Atari. Linux (and FreeBSD) are irrelevant because they have 68k
counterparts. Although, they are not much of a benefit on either platforms.
X is as much of a dog as any of the Windows are when it comes to resources
and applications support is rather spotty. (a.out or elf/motiff or xfree/no one's
written that driver yet...) Don't even bother with Solaris, SCO or NeXTStep. They
are priced way out of range of any sane consumer. QNX is just plain obscure.
You might as well run OS/9.

To be honest I can't post "verifiable" proof, although the above
statements have been considered valid in many "techie" circles...BUT
I do know that my Falcon 030 running at only 16mhz feels -much- more
responsive in normal, day-to-day use (especially everything from the
the desktop) than the Pentium 90 (mhz) that we have at work running
Windows '95...Strange, huh? I can just imagine how a Hades or Medusa
would feel next to a Wintel machine running at the same speed...Makes
me feel kinda sorry for them...<grin>

Yep. Supposely shipping this week to erase the 40,000 unit backlog. Power did
blow it. Hopefuly with the beginning of shipments to the que the backlogs will
erase..

> Interesting to note that most Mac rags had them advertised however. Talk

> card number to hold for a few months.....

Than don't.. Nobody is putting a p-shooter your head.. If Power doesn't suit
you, than there is Umax, Motorola and Apple.. What choices there are..

> So are you saying that all of Europe will be forced to purchase a

> you buy
> one?
> Don't bother to answer that, I think we all know the answer.

I don't know what Power's prices will be in Europe..

As for not buying a 604e machine was due to the pocketbook factor. I decided a
spanking new $899 Powermac Performa would do the job.... Same time next year,
a PowerBase 200 or equivelant will be around a grand..So who knows..

Sounds like sour grapes..Isn't that what Atari did with the Falcon? Selling a dream that never materialized when Atari pulled the plug on it shortly after the release?

>>GEM doesn't do much in features and functionality..
> Wha...?!
> GEM functions quite nicely.
> example: a floppy disk icon is on my desktop, I want to open it, I double

There still Atari programmers? Now back to classic machines.. I agree, old obsolete machines still have limited utility. Mac Plus and Mac Se's can be turned into fax machines for cheap, or run business accounts/record keeping..

I still think a MacPlus fish aquarium(sp) would be cool next to my PowerMac..

> No. Not Multimedia tools. They are not "tools" they are games. they are toys,

Interesting.. Don't forget very educational to..

>>Try running a quicktime video and real audio with CAB...
> yeh? why would I want to run a quicktime video, with or without audio?

To view content and sound espicially on the internet. These capabilities are
available on the other platforms for far less in cost than the Hades, Medusa
and the Falcon.

> a lot of wasted cpu cycles.

Wasted cpu cycles? Think not..You can never have to much processing power as
the market revs up the speed continously..

The 75mhz as you called nifty fit my budget for what it cost me. Considering
this was a past dicontinued model which was dwindling in supply in the reseller
storage room, I grapped one. Got the third last one.. There all gone
now..$895 with a gig, keyboard and fantastic software bundle was a steal..

> Either the faster machines possess no real utility, or the older
> slower machine has now been made a dog.

The old machines are considered a dog speed wise to the new faster ones. Just
wait when the Be OS is available..

Yep.. a do nothing one at that...

>>Sure can running old software like Mac plus users can find their machines
>>useful as a fish tank..
>

> You ramble on about your old software and your old hardware and
> then have the audacity to claim that ours is worthless because it
> is also old. Do you ever NOT contradict yourself?

Its not worthless if still provides utility according to ones needs. But you dismiss progress and attack those who want the cutting edge. My PowerMac is not considered cutting edge, but can run PowerMac apps quite well.

> So, what useful things have you done with your multimedia TOYS
> recently?

Observing Apple's webcast of the Cranberries.

> This sounds down right ATARIAN!!! '-)

That would be the case if Power is a one product family. Currently Power has a
40,000 unit backlog of PowerBase which supposely will be taken care of by
December with shipments down the que to begin this week.

However, Power has other lines with the PowerCenter line which have at least a
one week backorder wait. The Power Tower line are shipping and lastly the
PowerTower Pro units are shipping.

Unlike Atari which announced vapor that took at least a year later to ship in
miniscule quantities.

That maybe true in away. However, the efficiency issue is moot considering What Pentium 120-133 cost today. A third and or less the price of the $3000 plus Hades.. Lets see how effecient the Hades is when running real world apps...

MS Office loads with a snap on a $2500 loaded Pentium 200 box. Monitor and cdrom included..

Before you call something "true", check its validity. "We have run numerous tests" does not say anything about who has run which tests, what exactly the results where and so on. It can also not be verified. I could also tell you that I have run even more numerous tests that yielded results to the contrary.

>The Motorola 680x0 line has always been more advanced than the 80x86 line.

Verifiable proof is available where?

So? Why don't you use a more sophisticated benchmark or don't say anything at all.

>You also have to consider
>that the 'high powered' Pentium has to also run a kludge of an OS (namely
>Whinge95).

I could name at least 10 living, currently supported OS's that run on Intel-compatible CPUs. A Pentium doesn't "have to" run Windows 95.
(Linux. FreeBSD. Solaris. SCO. NeXTStep. QNX. OS/2. BSDI. Windows 95. Windows NT.)

>Run MagiC 5 on your Atari clone and you'll see much much better
>performance than your PC will deliver...

Yeah. Especially the antics of a supposedly memory-protective OS that crashes when a screensaver crashes. Not to mention the availability of software.

Liking your own system is great, but trying to put down other systems without any facts to show for it is not so great.

>Yep and getting cheaper. The Hades will remain in the stratosphere, un
>affordable..

I don't know where you get your information from, but if you really looked into it you would see that hades is less $$ than a middle of a line Pentium or PowerMac. It is very affordable and faster than either of the above at doing task oriented projects. We have sold quite a few to some interesting places where getting the task done reliably and quickly are the main goal. These machines replaced the PowerMacs that could not do the job.

It is not three times as much, maybe three times as much as an entry level PC, but not three times as much as a Pentium Pro, which is the closest in processing punch on the Intel side and our PowerMac 9500 is pathetically slow in comparison as well and it costs three times as much as Hades.

>Okay, run real world apps and get back to me..

What do I look a butler? What would the point be? You would just claim that they were false anyway. Why don't you come and try one out and see for yourself?

The middle of the line PowerMacs are from $2000-$2500 from Apple and less from
the Mac clones..

Top of the line Macs with 604e at greater than 132mhz start at $3000 and much
less on the Mac clones.. PowerComputing is selling the middle of the line
called PowerCenter with 604e starting at $1900 for the 132 mhz one..

Last I heard, the hades was $3000 or more... Task oriented projects is hogwash
when it lacks many of the apps that users on the other platforms take for
granted..

> It is not three times as much, maybe three times as much as an entry level

I guess you have tried a Hades and PM 9500 and judged them?
If not, it's _you_ who is talking BULLSHIT as you have no idea
what you are talking about. Do you?

Have you even seen a Hades? No?

Not really relevant, John, I just think if we're going to advocate our favorite BBS software, we ought to do it where the majority of readers don't have to wade through it to get to what /they/ want.

Incidentally, if you're looking for a really offbeat door gaem, try Cows! by Joe Blenkle. He frequents c.s.a.8 so you can still get a key for it.

Okay Pal!

You will probably say "Bull Shit" or some other explanative that shows your mental maturity...but... here are a couple.

Drag a 20Mb TIFF onto Photoshop on a PowerMac 9500 with 32Mb of RAM and tell me how long it takes to load Photoshop and display the file...

An equivalent Graphics package called PhotoLine on the DirecT60 takes less than two seconds.

Now, run the emboss filter on both. The DirecT60 performs the function in under 3 seconds.

All of the other filters take less time than this.

Obviously you don't have a 9500, we do and the times are 5-6 as long for loading and the filters take 3 times as long on average to perform on the 9500.

I could go on, but what is the point? You are not going to buy one or admit that it is a fast useable machine. You are happy with what you have and so be it. Our users are happy with what they have.

I just can't stomach your uninformed opinion being presented as fact.

Hades sells for under 2500.00 US, I don't know where you got your price from.

Send you one? Send me the money and I would be happy to.

Puleaze....What retail options are you referring to? You are full of BS as usual. I have not seen one iota of Atari and C= stuff in stores for at least a decade. Best Buy and the other super retailers stock modems and other accesories for the Mac. Not a burden. And if for some reason your retailer does not have what you want pick up a MacWarehouse catalog and recieve it the next day..No fuss involved..

Mac Performas shipping today include a 28k modem..

> We don't need options forced upon us because of pathetically poor
> retail support.

Who is forcing options on whom? Thats why Apple has two Mac brand line....The Performas for the home users and first time buyers which includes about all the options as standard. And the PowerMac flagship line for those who want to customize their system. Apple knows more about their customers(most of the time) than you do..

> Then you've just admitted that your recently purchase machine has been
> pushed into obsolescence as soon as you bought it. This makes it some-
> what of a waste. You blew nearly a grand on wha event you admit to be a dog.

I purchased my Performa because of the price/performance ratio. $899 with a gig HD, keyboard and software bundle was to hard to resist. I was on a budget and this close out model fit my budget. Plus the internal 4x CD was ice caking..

How much does this PhotoLine cost ? May it be that the software is doing the
difference ? What operating system are you considering ? Sorry but here in
Italy we have very small info about this.

I guess Peter has finally fallen off the edge of sanity (he's always been a bit precariously balanced, apparently). Last night, I got 2 messages from him at home, and today here at work, I got yet another. I have repeatedly stated that I would publish flames (or that I might - same thing, really), and certainly Petey Boy knows I don't want to hear from him.

To outline the situation: He's gone paranoid, and seems to think that "imposing the Usenet Death Sentence" means something other than "you're consigned to Coventry" (or "we're all going to ignore you now, Peter"). I only wish it did. <SIGH> However, for the amusement of anyone who gets his jollies from such things, here are two of the messages; one from last night, and the one he sent to me here at work.

...when it comes to modems...

When it comes to modems, PC's, Ataris and Ameobas have always been
interchangeable. A Mega4 ST could use the earliest US Robotics Courier
Modems and can use the new sportsers as well, as well as any other
RS232C PC modem ever made...

This is an advantage of not uneccesarily bucking the standard.

Unlike macs, Atari's don't need a big fat "It's made for your machine"
label on it.

>accesories for the Mac. Not a burden. And if for some reason your retailer

4x CD is only iceing to a Mac user. The rest of the ATA world will just get
by with our better, cheaper, non-forceable options...

What's the word on Falcons and ATA CD rom drives?

Also, price/performace ratio then doesn't do anything to deal with the fact
that it is a dog now...

Applications are NOT the OS. You haven't the slightest clue as to where
this distinction lies. Admittedly there are some tangible differences. However,
you have yet to mention any of them. The best you can do is come up with
a few applications and an api spec. or two.

>
>> You really are quite stupid in that respect.
>
>Me...A pig headed ferengi in that respect..

It is not Ferengi to understand the distinction between applications, that
are overhyped at that, and the OS. This doesn't make me Ferengi: it makes
me more literate.

You only serve embarass Apple with your inept advocacy. Many more do it
much better. You should leave it to them.

>
>>>> So, what useful things have you done with your multimedia TOYS

Actually, David is a rather avid Mac user. It just goes to show that all of your
'kind' aren't sucked in by hype.

Actually, that paraphrase was a response to a comment made to him that your
comment could have been a paraphrase to. The response was to Bill Gates....

As far as ratings go: they are the sort of thing that you should steer clear of, for
they make your advocacy look weak.

For Macs are loosing the 'ratings' wars...

It is an inefficent medium with with to deliver and mission critical information.
It is really quite stupid to limit one'sself to 10BaseT or even 100BaseT speeds
when one can go quite a bit faster. This is assuming that you're lucky enough
to have a T1 or an ISDN. Both are rather expensive, even if your organization
doesn't have limited resources.

Anything slower just wont cut it. Unfortunately, 'anything slower' describes
the very vast majority of network connections.

This appears even more absurd when one considers that delivery mediums
with necessary thruput are quite common now. Too bad people like you
don't want to use them.

We have a similar outlook when it comes to computing. Rich and company
can be relatively sure that my observations will be more relevant to them
than will be yours.

>Typical ferengi thought..

Jeeps & trucks have been around for quite some time. They just happen
to be a fad these days. Jeeps have been around since the 1940's and
the cherokee/wagoneer/suburban type vehicles have also been around
for at least 20 years and share most characteristics with trucks that have
been around for much longer.

Once again, you let yourself get sucked in... into the hype...

Ferengi, coming from you, is actually complimentary.
It implies a pragmatism that you do not posses.

>I will wager that Photoshop on a lowend PowerMac will toast
>any 060 machine..

This is a pretty bold wager, you have not seen this machine and what it can do. I would be a little more careful with my wagers if I were you.

We have tested a 9500 here as well as PhotoShop running in Native Mode and the T60 with PhotoLine and/or DA's Repro runs circles around it without breaking a sweat. PhotoLine does not have as many features as PhotoShop, but it has all the necessary features, so it should come as no surprise that it is faster running code. DA's repro is more advanced than PhotoLine in many ways, and it is much faster as well.

This is all from experience.

Apple is in deep do-do and the industry does not expect them to survive as we know them today. Sad news really. The last press release from Apple is only going to hurt them more. They are now looking at Fall of 1998 for a full 32 bit preemptive multitasking OS upgrade. They are so far behind the times...

I can do that on my Powermac. No mess, nor fuss. I just added a 16 meg sim
and two minutes to install.

An Amiga that can't do much today. Most Amigas are low res ones. Actually I
keep my machine on all day. When I come home just load up Netscape and cruize
in all it's glory..

Funny, right before this posting I read one from Computer Direct that
stated the '060 Atari using PhotoLine blew away a Mac 9500 that was
using PhotoShop...Huh, what about that... <grin>

The Falcon may feel more responsive when opening up windows. etc..However, the processing power on the Pentiums when using real equivelant apps on a Pentium 90 which is considered antiquated today will eat the 16 mhz 030 Falcon.

First of all I agree with Paul that this does not belong in an Atari
newsgroup at all...Bored today, were we, Mr. Sinclair? :)

Second, the Amiga -still- exists...it did not end in 1994. (perhaps
you are referring to Commodore?) There are millions of Amigas in
existence...(although, like Atari, I don't have any idea how many
are actually still being used) They are still pretty awesome machines,
having the best integral, core multitasking anywhere...I much prefer
the user friendliness of TOS/GEM but like Atari's, the Amiga is also
pretty effecient with its system resources and does not require tons
of RAM/CPU speed/hard drive space, etc,...unlike Macs and PC's.. :)

Look at the first paragraph -again- and follow the point of the thread,
Mr. Sinclair...point being not how a 90mhz Pentium would "eat" a Falcon
but that an '060 equipped/TOS based computer would match up very well
indeed with comparable Pentiums... :)

Oh, BTW, I think that running "real, equal apps" such as Calumus SL,
CAB, Cubase Audio, Apex Media, etc, etc, (long list dude) on a Falcon
is very comparable to "real apps" on a 90 mhz Push-me/ho-hum er, Pentium!

<heh>

Now you state that Photoline does not have as many features as Photoshop but
with all the necessary features to be compared with Photoshop. Sounds like
doubletalk here. Who decides what is considered necessary features or the
ones that Photoshop has and Photolite does not have..

MacPublisher has two thirds of the features as Pagemaker and in my own opinion
is more responsive than Pagemaker.

> This is all from experience.
>
> Apple is in deep do-do and the industry does not expect them to survive

> Apple is only going to hurt them more. They are now looking at Fall of
> 1998 for a full 32 bit preemptive multitasking OS upgrade. They are so
> far behind the times...

Apple was in deep do-do months ago due to some stupid mistakes on the part of
the previous management and the press fud. The industry has been predicting
Apple's demise for twenty years. Under the new regime, the financial house is
in order and more focus direction in their strengths. Plus Mac clone firms
such as Motorola, PowerComputing and Umax will expand the market.

I went to a close door Apple briefing yesterday but can't divulge in what was
discussed due to signing a legal document. However, keep an eye out at
Cupertino in the next weeks to come..I came away impressed..Apple did state
that they were doing very well with their high end line..

If you want an inkling in what is comming soon, check out 'macweek.com'
..Awesome issue!

If it wasn't proprietary, I'd be happy to send you a listing of Team Amiga members worldwide that would part your hair (if you have any left after having to deal with that Mac all day)? Our user base may have dwindled somewhat, but those of us who are left are a special breed of people not matched in other community. And, that, I'm sure is why you are here so much. Pity is that you have gained nothing by osmosis ... though we all here keep hoping.

Brilliant argument.

>Now you state that Photoline does not have as many features as Photoshop but
>with all the necessary features to be compared with Photoshop. Sounds like
>doubletalk here. Who decides what is considered necessary features or the
>ones that Photoshop has and Photolite does not have..

No, This is not what I stated. This is not double talk. I merely put the test into perspective. Photoshop is bigger and slower
code than PhotoLine. PhotoLine does not have all the features of PhotoShop. The statement was made in order to clarify that this
should be taken into consideration. For somebody who works in a library, you don't read so good.

There is no easy way to compare a TOS compatible with a Mac OS compatible since we are talking two totally different operating
systems. The MacOS is bigger and slower code than TOS. Atari software is much more optimized than Mac software, it executes
faster and uses less overhead. This is why an 060 running TOS and Atari software is so fast. The PPC is definetly a superiour
chipset than the 060, no doubt about that. The MacOS and software slows it down though. This is the real issue here.

>Cupertino in the next weeks to come..I came away impressed..Apple did state
>that they were doing very well with their high end line..

You must impress easily.

I think the point is that that the OS isn't polished, it wastes
processor time, maybe you can afford it to be wasted but it's still a
waste.

The function being compared is all that is being debated, this is a
proper task that is completely integral to the working of a graphics
program. Back to the old car anology again you can't say that the F40
is a less powerfull car than a Ford Fiesta just becuase the F40 doesn't
have intermittent windscreen wipers and 5 seats.

>>

If you meant to type 'then', then it's hardly a fair comparison, is
it? Ho much was a 9500 back then?

>> Send you one? Send me the money and I would be happy to.
>>
>
>Why? You made claims..

Yeah he made claims and you haven't seen the machine and keep
disputing the claims, there's no way you'd buy a machine because you
couldn't admit being wrong. Would you send me a 9500 is I said my ST
was more powerful than it?

This is quite a lame response. You don't even really know what you
are arguing. This is to be expect as you never do know what you're
talking about.

If an 060 machine cannot compete with 686's and 604's then that should
be considered anamolous, no the other way around.

[deletia]

Why not? That is quite an ordinary price for that class of machine.
686's and 604's go for the same amount of money or MUCH more.

If size is that important to you David, that's 16368x16368 at 16 colors. But who needs a screen that big anyways?

To some of us 'size' isn't important, ours is already as big as we need it to be.

Message-ID: <558274596.52577.09.starship@3rdplanet.com>
Source record: 8332

I got a nice apology from Peter yesterday and we've had a civil dialogue in email since then. I'd like to suggest that we try to give him an opportunity to be a positive contributor to this conference (rather than the flame-bait that he has been). While he can be confused about what's OS and what's applications from time-to-time, he's hardly got a corner on confusion <G> and I don't know anyone who's never made a mistake, yours truly included.

So let's see if Peter will be willing to give us all a chance to make a friend of him - after all, we as Atarians have more in common with Mac users than we do with "PC Pukes" and it's often useful to get another approach to any problem or task - we all know that, while it's not /our/ choice, the Mac is a pretty nice machine in most cases (let's ignore the Performa that was sold by WalMart).

What I suggested was that we stick to the the "this is what I like" or "this is how I do it" approach, rather than the MCIBTYC routine that's been the rule here in the past.

And let's try to avoid the ad hominem attacks that most of us have been guilty of in the past. They certainly don't contribute much to the flow of useful data.

I won't be putting my money into a Mac, but I sure don't mind seeing how they do the things I do - I've "borrowed" more than one idea from Mac in the past. <G>

Hi Ken,

Spectre will not work on the Hades or DirecT60 for two reasons,

1-) It never worked properly on a TT

2-) Hades/DirecT60 does not have a cartridge Port.

All the best,
Chris

We have run test on Calamus SL on DirecT60 and compared them to the same tests on Pentium running Calamus on both Win95 and NT and well... the DirecT60 is faster.

Calamus NT and 95 is the fastest DTP package on the Pentium.

All the best,
Chris

Sure Peter! Sure! The little extra time a Falcon uses on everyday
use compared to a 90Mhz Pentium, it takes back in slick interface! My
Falcon boots in 18! seconds. My wordprosessor use approx. 5 seconds to
load and it's a hell of a lot faster to use than ANY, I repeat ANY windows
word-prosessor I've ever tried, and I've tried a lot!
That's what I love about Atari computers! It feels like driving a
sportscar, and even though the engine is not as powerful as those found
in the PC trucks, I get from A to B just as fast, and often faster!

Eh... Too many exclamation marks, or?

If the Mac's can't keep up with the simple stuff, it's rather absurd
to think they'll keep up when real work has to be done.

5738. Example of my mental maturity (Was going to be SinPlops machine)

Newsgroup: comp.sys.atari.advocacy
Date: 1996-10-07 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <325A00D9.7DC4@owens.ridgecrest.ca.us>
Source record: 8347

After reading Sinplops post concerning the model
Mac he purchased, I must really question his
sanity. No one, I mean no one would purchase
a 7XXX series Mac that wanted to USE Photoshop.
This indicates that he must not own the application
or enjoys jerking off while he is loading a 20mb
tiff file of some thin peckered kid that he admires
at his state provided home. What does the pic look
like on your machine over 1024*768? Like shit i'll
bet. I know you didn't spring for a video card. It
would cost you more than your Mac did, dickhead.
Only have 16mb? So your running virtual memory just
to load the 20mb file for compairson. How many
extensions do you have to disable just to attempt
to load it? Does you hard disk sound like a broken
music box? Notice your mouse gets jerky (guess it
could be your other hand whacking the old Iowa Corn
stick). Can't select other windows during the process?
Get real, to many of us use Mac's every
day. We know what they can and can't do. Keep your
bullshit for your first employer, you will need it.
Yea, virtual sucks on the System O/S. Oh, yea, wait
for BE, wait for BE. Copland's comming, Copland's
comming. Ya, and so are United Nation owned parks
in the U.S., that surely isn't a good fu**ing thing
either. Maybe some of your political favorites will
get elected and they will do to Iowa what they have
done in California and Utah. They will fence off
all of your farm land and restrict travel to foot
only. You'll be in trouble, as you have one foot
stuck in your ass now.

(Room for SinPlops comeback here)

Just a no name little dick that likes to stir up
shit in someone elses home.

(more wasted space)

When you get to your final goal of waste management
personnel, i'll be sure to flush a big turd to
you.

(Somebody give this guy a mouth dusch)

Mike

He,he! Sorry! This is what I should have written:
"My Falcon boots in 18(!) second."
Or maybe, more correctly this:
"My Falcon boots in 18 seconds!"

Thanks for pointing it out!

Photoline is a 200 USD image editing package. DirecT60 is a 68060 based Atari TT clone running TOS3.06.

All the best,
Chris

> of RAM/CPU speed/hard drive space, etc,...unlike Macs and PC's.. :)

The Amiga barely exists. The only Amiga model that rarely exist is the $2800 040 A4000T which has even worst price/performance than the Hades.. Only a handful of the A4000T have been sold not enough to exist as viable. Considering this is a 1992 design and were almost to '97'.. Again, the Amiga doesn't have the near functionality as a PC/Mac does today..

Just a Pentium 90? Running what OS? You can't even buy a Pentium 90 today, okay if you look hard enough in the Computer Shopper. The Pentium 133 is the bare minimum today. Know what they cost today? Much less than $2500 Hades with out monitor and CD!

What are you babbling about? Has any $2800 040 Amiga 4000T been sold this year
in NA?

> But we don't HAVE to add that 16 meg simm you had to add to just get
> functionality and that is the point I am making. Good try, but alas ...

Yes you do when you use the Video Toaster and LightWave...
Lets see I paid $88 for a 16 meg sim and now have 24 megs ram..Just right..I
still paid far less than - just above 1/3 the price of the $2800 040 A4000T!

> Oh, please ... my 3000 runs high-res laced and so do most of the others out
> there. As far as internet, we have IBrowse, Aweb, Alynx, AmFTP, AmIRC and a host

In 4 color mode..Must be enough to view the pages in glorifying color.
IBrowse, Aweb, Alynx, AmFTP costs extra, only Amiga! I don't know about you,
but Netscape is continously updated by the sweat of the programmers as well and
is packaded in all Mac boxes part of the Internet Connection kit.. Amiga users
pay more for less, only Amiga!

> If it wasn't proprietary, I'd be happy to send you a listing of Team Amiga

> to my old, dying, derilect of a computer ... an Amiga 3000/25.

ROFLMAO!! The Amiga 3000 was passed years ago.. Not speaking for MS, Apple has
great tech in the software area like Cyberdog and QTVR...Nothing like that on
the Amiga, only Amiga!

The Mac OS does more costs less than a TOS 060...Try running Cyberdog and
Quicktime VR on TOS 060...

Heck, ClaisWorks loads up faster than Word but has less features to speak of.
Now you compare a PhotoShop lite clone to the real thing is pathetic.. Next
time try eqevelant apps next time.

Comparing feature to feature and functionality to functionality is the issue.
Photoline is not equivalent to Photoshop...

> And you saw photoline when and where?

Stated before, photoline is not equivalent to Photoshop on a feature to
feature.. Like me saying that ClarisWorks is equivalent to MS Office..

> Yeah that would obviosly be the most likely explanation, you (the one
> with neither machine) would know better than the person with both.

You made the claim..Do you own both machine?

> Sounds like you can't take defeat.

Take what defeat?

> If you meant to type 'then', then it's hardly a fair comparison, is
> it? Ho much was a 9500 back then?

Today, a 132 mhz 604 box is $1899, much less than the Hades..

A PowerTower 166 is around $2500..You're money..(TM Bob Dole)...

> Yeah he made claims and you haven't seen the machine and keep
> disputing the claims, there's no way you'd buy a machine because you
> couldn't admit being wrong. Would you send me a 9500 is I said my ST

Find an equivelant Mac app, and we will see.

By the way what version of Photoshop were you using?

>>The 9500 must be screwed up...

Again what version of Photoshop?

> Bingo!
>
> Sounds like you have experience with this part of your body.

Typical..

>>The press release way back than.. Still to expensive for an 060 class.
>
> Oh! I see, so if we also used the press release from way back when the 9500 came out at
> close to 7500.00 that would be a fair comparison then?

Interesting...I thought the 9500 was around $5000 when first released.. $5000
buys the fastest 225 mhz PowerMac.. An equivelant to the 9500/132(no longer
made) costs $1899..

>>Why? You made claims..
>
> You said you wanted me to send you one. pay me for it and I will send it. Or are you
> just being you?

Why would I buy an antique?

Can you buy a 90Mhz Pentium today? The baseline one is 133mhz. Who cares if your Falcon boots a WP that is not up to snuff to the others on the other platforms.

Okay...How about easier than any Mac wp?

That will do when using ancient apps...Thats how it feels on mine too..

> heard is no longer being updated...Apex Media, whats that?

I think the latest version of Calamus SL was just released some weaks ago. Cubase Audio was also upgraded a month or so ago and CAB is also becomming much better for each release. Apex Media is a very good realtime graphicsprogram for the Falcon030/040 and a new version which is completely rewritten is out later this year. There is also Apex Audio on it's way later this year which will be awesome. There is also talk about Apex FFT for _very_ advanced soundprocessing for professional use. :-))

I started in 1984. The term didn't even exist vis-a-vis computers until Mickey$lop finally managed to get us at Intel to make a CPU fast enough to keep up with the bloated code coming out of Redmond, but combined graphics and sound have been available and used on Atari/TOS systems since shortly after the release of the 520ST. One of my favorites is a movie (the name of which escapes me at the moment) starring Ralph Mariano's cat (doing evil, cat-like things to the dog); another really good one is Spider Patrol. Both of those are over ten years old. I hooked to video output of my ST to a VCR a couple years ago and recorded a demo tape for the local Fidonet sysops; these guys were all running the hottest available PCs at that time, and to a man, they were favorably impressed with the multimedia capabilities of my system. It was about nine years old at that time. The Falcon and new TOS clones are far more powerful and faster, easily capable of much better performance using the exact same software, or of stunning feats using modern applications. It was just 4 years ago that I saw the "Tina Turner" movie running on a Falcon. There wasn't a Mac or PC system that could touch it at that time; the DEC Alpha was about equal as long as the performance was silent, but fell down when sound was added.

The Mac is a good system. However, it's NOT the topic of this newsgroup. Please try to remember that, lest you suffer the warth of the net.gods once more.

You are no position to tell anyone whether or not those apps are not
equivalent. The only reason we might know that there is any difference
at all is because of the forthcoming nature of the tester. You are completely
ignorant on these matters.

Well, Peter, up to your old tricks, I see.

You keep going on about this "Cyberdog;" what the heck is it? I have a lab
here with every sort of Intle machine ranging from a 486/33 to multi-proc
P/200 servers, and out of more than 200 engineers within spitting distance,
not a single one of them even knows what "Cyberdog" is. If it's so great, how
come Mickey$lop hasn't stolen it for the PC yet?

OpenDoc and OLE are both software component specifications.
They aren't limited to your precious little Cyberdog. You have yet to
address what the value of a megolithic application built from 'parts'
gives you that a bunch of 'parts' as standalone applications will not.
Both are primarily for dealing with the consequences of trying to build
apps that attempt to do everything and still have to be loaded into a
'real' limited resource machine.

Maybe you would like to explain what PhotoShop does that Photoline does
not?
Then, back up your statements with proof, meaning you must compair the
two
programs with experience that you gained first hand using both.
I honestly don't think you OWN Photoslop, but give it a shot. Demo
versions
of either don't count. As a matter of fact, I can do it right now with a
simple keyboard stroke. Let's use a 20mb Tiff for performance ratings.
Let's see how your 24mb of ram in your powersludge compairs to the 128mb
ram capacity of my simple machine. Better get that virtual memory turned
on.
I'll be watching your post to check for accuracy. My stop watch is
ready.
My filters are ready. Kia's don't count. Let's start the equivalency
test.

>
>Calamus SL, does it exist?

Quite obviously yes.

>CAB, just shareware?

Just because in the PC/Mac world a shareware program that just prints
"My name is Pete" on the screen will cost you $102.56 doen't mean that
it aplies in the Atari world. It's a fine program and it's not really
shareware anyway, it's freeware with donations if you want to and it's
certainly not the typical share/crippleware.

>Cubase Audio, from what I
>heard is no longer being updated.

So what? I know you aren't used to good quality programs with few/no
bugs in them but it doesn't mean they don't exist. You are so typical
in your update mentality, i'm sure you upgrade your programs when you
know you won't ever use any of the extra features.

>Apex Media, whats that?

Your ignorance is more astounding than ever.

The Toad thread is taking quite some time as Pete answers questions
with stupid "your machine must be broken" answers that often even have
nothing to do with the questions asked. Due to the nature of Usnet it
means that it takes weeks to get an ounce of sense and so I propose
that maybe we take the debate ot IRC and whizz through it there, I'd
certainly love to. A time acceptable to both US & UK citizens would be
nice, possibly Sunday (this or next week)? If anyone is interested
then post to this thread and if some people are interested and Pete
can handle it then we can sort out a time.
I look forward to hearing from you all.

>
>Comparing feature to feature and functionality to functionality is the issue.

Exactly, the feature we are currently comparing is the ability to load
a TIFF, the Apple machine isn't as fast.

>Photoline is not equivalent to Photoshop...
>
>> And you saw photoline when and where?
>
>Stated before, photoline is not equivalent to Photoshop on a feature to
>feature.. Like me saying that ClarisWorks is equivalent to MS Office..

That was not the question, it's still there, read it slowly, get
someone to read it to you if you have to and reply. It's easy!

>> Yeah that would obviosly be the most likely explanation, you (the one
>> with neither machine) would know better than the person with both.
>
>You made the claim..Do you own both machine?

I don't recall any claim, just you 'debating' someone elses results
when you have no way of knowing the truth or at least no will. If you
saw it I'm sure you'd swear it was actually an apple in a different
case.

>> Sounds like you can't take defeat.
>
>Take what defeat?

The one here the 9500 wasn't as fast, you've just proved you can't
take it by pretending you don;t know what I'm talking about.

>> If you meant to type 'then', then it's hardly a fair comparison, is
>> it? Ho much was a 9500 back then?
>

>Today, a 132 mhz 604 box is $1899, much less than the Hades..

Less speed for less money, sounds fair.

>A PowerTower 166 is around $2500..You're money..(TM Bob Dole)...

I'm afraid that I am not actually money.

>> Yeah he made claims and you haven't seen the machine and keep
>> disputing the claims, there's no way you'd buy a machine because you
>> couldn't admit being wrong. Would you send me a 9500 is I said my ST
>> was more powerful than it?
>
>I don't have a 9500 at home but 7600/132's at work..

I know that but that had little to do with the point of the question.

Introducing the MPOWER line of Mac OS compatible personal
When we asked our customers what they wanted in an Apple Macintosh compatible clone computer, we weren't surprised to hear that most of them wanted two things: great performance at a great price, and the ability to order the system they want, with the drives, and other options they need, but without a bunch of "features" they neither need nor want. The APS MPower series of personal computers is designed to accommodate both of these requests. Priced hundreds of dollars less than systems with similar performance and features, APS MPower systems deliver the exceptional performance of Motorola's 603e and 604e PowerPC processors. APS MPower systems offer a staggering array of storage and peripheral options - and why not. APS Technologies is the premier supplier of storage and backup products to the Macintosh market. Our "Build Your Own Box" option lets you configure your own system with an astounding amount of flexibility.

The Best Engineering - Motorola

When we asked our customers what they wanted in an Apple Macintosh
* Motorola - manufacturer of the PowerPC processor &endash; no one knows it better
* MPower takes advantage of Motorola's quality processor technology, innovation & reliability

The Best Service and Support

* MPower comes from the company you've known and trusted for years
* MPower has the backing of APS' award-winning service and support

Exceptional Value

* Best mix of advanced processor technology and high-quality
Whenhardwared our customers what they wanted in an Apple Macintosh
* Compared with other personal computers running Mac OS, APS' MPower gives you the most for your money

Most Configuration Options

* APS, the recognized leader in Mac data storage solutions, has the hardware that you want included with your next Mac OS system - hard drives, removable media devices, and tape backup systems

APS MPOWER 603E160 $1399
Wh* The best value in PowerPC computing!nted in an Apple Macintosh
* 160MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays

* 1.2GB hard drive
5
* 8X CD-ROM

* Monitor sold seperately

The new benchmark in PowerPC, Mac OS computing, the APS MPower 603e160, for under $1,400, is the value leader in RISC-based workstations. The perfect home, or mass application PowerPC computer includes a 1.2GB hard disk drive, an 8X CD-ROM, and 16MB (upgradable to 160MB) of RAM. The APS MPower 603e160 includes a mouse, ADBtosh keyboard, three PCI expansion slots, and two available 3.5" drive bays. One-year limited warranty.

APS MPOWER 603E200 $1599
* The ideal mix of performance and value
* 200MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays
* 1.2GB hard drive
* 8X CD-ROM

* Monitor sold seperately

7
Outstanding performance at a terrific price, the APS MPower 603e200 is the bang-for-the-buck system of choice for individual and institutional users alike. Powered by Motorola's 200MHz PowerPC 603e processor, the APS MPower 603e200 comes ready for action with a 1.2GB hard drive and an 8X CD-ROM. Run most applications in the installed 16MB of system RAM (upgradable to 160MB) and enjoy the exceptional performance afforded by the 256KB of Level 2 cache and 1MB of VRAM. Three PCI slots and two available 3.5" drive bays let you add a whole range of PCI card and peripheral options. With the included mouse and extended ADB keyboard, this is the value-priced performance system of choice. One-year limited warranty.

APS MPOWER 604E200 $2599
* High-performance mini-tower PowerPC system at an exceptional price
* Blazing fast 200MHz PowerPC 604e processor
* Five PCI slots and four available drive bays

* 2.5GB hard drive
* 8X CD-ROM
* 24MB of RAM

* Monitor sold seperately

Blinding speed and exceptional value set this high-performance PowerPC, Mac OS workstation firmly at the top of the heap. The APS MPower 604e200 comes equipped with a gigantic 2.5GB hard disk drive, an 8X CD-ROM drive, and 24MB of RAM (upgradable to 160MB of EDO DIMM RAM) - and that's just for starters! Turbocharged with 2MB of VRAM and 512K of Level 2 cache, the APS MPower 604e200 includes five PCI slots for video, networking, peripheral expansion, and other PCI-based cards. The roomy mini-tower design includes four available drive bays for optimal customization of the high-performance MPower 604e200. One-year limited warranty.

Just give MS some time...They did not know what a web browser was until
recently..

Apple's Cyberdog 1.0 Ships

First Integrated Internet Suite Offers Tight Integration Across Internet
Applications and Mac OS

WWDC, SAN JOSE, California--May 13, 1996--Apple Computer, Inc. today
announced shipment of Cyberdog 1.0, an integrated software suite that
provides easy and intuitive access to Internet resources. Cyberdog was
released to thousands of developers at Apple's Worldwide Developer
Conference. A consumer-oriented version of the product, including
broad distribution, is planned for later this year.

The advantage to Cyberdog is that it offers the first Internet suite
of products with a common look and feel, offering easy drag-and-drop
control across different Internet services, as well as tight
integration with the Mac OS and Macintosh OpenDoc-compliant
applications. The result is that Cyberdog's browser, mail reader,
Internet address notebook and news reading components are completely
integrated with one common interface to accomplish Internet tasks.
Cyberdog's integration with the Mac OS and Macintosh applications
embeds Internet resources throughout the user's work, making Internet
connectivity an extension of the desktop. For example, a user can drag
and drop a live URL to the desktop, driving Internet links from the
operating system rather than a browser.

"Internet access has been dominated by the application browser," said Larry Tesler, vice president of Internet platforms, Apple Computer Inc. "What Cyberdog offers is a new level of integration by putting Internet access directly into the Mac OS and Mac applications. Instead of putting everything into the browser, Cyberdog puts the Internet into everything."

OpenDoc: The Technology That Brings Web Information Alive
Cyberdog is based on advanced technology called OpenDoc that lets disparate software modules work together as a seamless application. OpenDoc is an open standard that is available to third-party developers to instantly make their applications interoperable with other OpenDoc applications, as well as Internet-enable them with a link to Cyberdog. The benefit of OpenDoc to end users is that it gives them the freedom to replace one of Cyberdog's components with one offered by a third-party.

Cyberdog: Tools for Managing Internet Use
Cyberdog also provides DocBuilder, an OpenDoc application that supports inclusion of Cyberdog components, along with text and graphics. With Cyberdog's DocBuilder, and the availability of future OpenDoc-enabled word processing packages, users can create intelligent documents that combine text, graphics, data and information from the Internet. A single document can contain previously disconnected combinations of sound, real-time Web site links, graphics, text and pointers to relevant newsgroups. This document can be shared among Cyberdog users as "live" text which can be used to directly access the 'Net. These documents are a powerful communications tool because they easily
organize and distribute Internet information and resources. A corporate Internet support organization could use these documents, for example, to easily direct end users to those Internet resources they considered valuable.

Cyberdog: Superior Mail and News-Reading Features
In addition to browsers for Web, Gopher, and FTP; telnet, notebooks for storing Internet addresses, and a log for tracking sites visited, Cyberdog offers superior mail and news-reading capabilities. For example, Cyberdog can manage multiple email addresses, allowing users to easily manage incoming mail from various mailboxes. Mail handlers can identify prioritized and unwanted mail, and categorize it for the user. A sophisticated search mechanism helps find emails by content, and can also archive Internet News Group Information. In addition, the message editor for mail and newsgroups supports full-styled text, including graphics, and "CyberItems." CyberItems are icons that represent links to Internet resources that can be easily clicked on to open and display resources, including Web sites, newsgroups, telnet sessions or files.

Third-Party Developers Offer Cyberdog-Friendly Applications
Numerous developers are already actively developing or enhancing applications to work with Cyberdog. Making an application "dog savvy"

is as easy as supporting OpenDoc, and instantly makes applications Internet-ready.

For example, Macintosh word processing software vendors such as Claris, WorldSoft and Digital Harbor are supporting Cyberdog to enable their applications to develop "live" documents that link to Internet resources.

In addition to Cyberdog-enabled "live" documents, developers are offering a host of capabilities to Cyberdog users. Addison Wesley is developing interactive CD-ROM titles that use Cyberdog to retrieve content from the Internet; Corda Technologies offers a graphing component that uses Cyberdog to graph information directly to web pages; and OnBase Technology is offering users an alternative to the standard Cyberdog notebook.
For developers, third-party suppliers are offering several tools to promote OpenDoc and Cyberdog add-ons. Spyglass is offering a Web Technology Kit (WTK) that offers components for making applications, services or devices web-wise. The Spyglass WTK supports Cyberdog as well as HTML browsers, giving users the option to plug in their preferred browser. ResNova software has announced the development of a Java applet viewer for Cyberdog called "CyberJava." This component enables the user to play Java applets within any OpenDoc document, not just Cyberdog components. Kantara Development is offering developers "PartMerchant," an online source for buying and selling OpenDoc components that are based on Cyberdog.

Price and Availability
Cyberdog will be distributed free of charge on the Apple Web site (http://cyberdog.apple.com/). The Golden Master version is available today, with broader distribution planned for later in the year.

Translation: Cyberdog = the apple equivalent of the do all megolithic
internet app.

Cyberdog = Apple Navigator or Apple Explorer.

Touched a raw nerve there with my 'size' remark, Mr Day? No I do not speak for
the entire Amiga userbase. You fail (once again) to read what is written.

I said 'to *some* of us size isn't important'.

BTW ... no one in Team AMIGA (including me) speaks for anyone else.

5788. Atari ABC 386sx question???

Newsgroup: comp.sys.atari.advocacy
Date: 1996-10-13 00:00:00 UTC
From: Stoyan Kenderov <kenderov@xlink.net>
Message-ID: <3261450D.347C205D@xlink.net>
Source record: 8247

Hi everybody,

I got an old but running ATARI ABC 386sx portable and has only been
able to attach a mouse to the one marked as "RS-232" serial port at the
rear side.

Hawever, there is a small (Apple-ish) port on the left side of the
RS-232, which is marked as "mouse".

Well, I went at the local hardware store and bought an addapter in
the hope to be able to connect my 9-pin D-type mouse-plug to this small
port.

But..in vain...PC-CHECK and MSD are telling me that there is only one
single UART inside ???

Is this true???
What is this port for??? And why is it marked as "mouse" ???

I have no kind of documentation for the ATARY and will be extremely
greatful for any kind of help.

regards,
Stoyan

PS: forward a copy of your reply to my e-mail adress, because I don't
subscribe this newsgroup...Thanx

>Sorry, you were wrong ... it can and is ... right now!

Gary, it can't without a high-priced graphics card. And given that
all of those high-priced graphics cards are DRAM-based, it isn't
competitive, speedwise, with the VRAM-based PC graphics cards, which
are significantly faster at high resolutions and color depths.

I don't consider 724x484 to be high-res by 1996's standards. 1024x768
is a fairly normal resolution, and 1280x1024 is moving into the
"high-res" category.

It makes it easier to convert people. I still regularly run M$-DOS
because there's so much stuff for it that I use, and it's useful to be
able to access my M$-DOS partition when I'm in Linux (which, IMNSHO,
beats anything Bill Gates could dream up on his best days).

Are you stating that that the Mac OS is not polished and TOS is? If so, you are smoking some silly stuff.

Whats this processor time crap.. Who cares? Can your OS run Quicktime 2.5, VR, OpenDoc, Cyberdog and contain QuickDraw 3d?

When it does, get back to me..

My net software is current..Thanks for caring..

Afford is an issue. My system's price tag was 1/3 of the Hades and is the issue. Plus it came with over $500 in apps, only Hades!

What's so great about CyberDog? I tried it, after downloading the 20M
7.5.3 update and the 3 disk 7.5.5 update, and downloading OpenDoc 1.1,
enabling OpenTransport 1.1, and grabbing CyberDog, I finally got it
working. Granted, I'm using the dead-standard browser and such, and
the real power seems to be how you can arrange pages and
functionality, but the standard mail/news/www clients are _horrible_.
CyberDog's WWW browser is the slowest I've used in recent memory (no,
I've used nothing on the Amiga lately...) and it's _really_ something
that Apple's proud of this new technology. I think it will be
interesting if and when plug-ins become commonly available, but until
that time, CyberDog is, IMHO, to be avoided.

Machine used: 24M 6100/60. Netscape 3.0 runs, if not quickly on this
system, then at least it runs.

The Mac is many things, but fast isn't one of them.

That's most likely a PS/2 bus mouse port. I have NEVER been able to get a bus
mosue to work with an adapter on a serial port, and never gotten a serial
mouse to work on the bus port. Solution: Spend US$10 and buy a cheap bus
mouse. It will probably come with any required drivers.

They may be faster, but they cost more than the DRAM cards and are less common becasue of it. Speedwise, you need a fast (100MHz+) Pentium with a PCI motherboard to compete with Amiga or the new Atari clones when it comes to multi-media. This is not to say it can't be done; simply that it isn't as cheap and easy as you seem to beleive.

Aside: I know Michelle is gone - is Scott still throwing his weight around and reading "private" email on the board?

>
>Why should they support Microsofts junky filesystems?

Because in order to make any inroads into the PC market, any OS has to support
the existing customer base. It should also be pointed out that the 8.3 file
system is NOT mickey$lop's invention - it was stolen intact from CP/M; the
Win95 long filename system is more-or-less the same as the NTFS without the
total incompatability introduced by NTFS; which is in turn very similar to the
miniX file system.

Thus, I am suggesting that Apple do something that is both economically
competititve, and supportive of the target customer base. This is called
"marketability" - something Apple has neglected for rather too long, I'm sorry
to say.

Ah. Well, in that case, we have the same thing on the ST using Teradesk and
the WWW suite. I can install CAB as the app to launch when opening an "html"
file type, and it will automatically launch and load; this is also true with
the buil-tin GEM desktop on all versions of TOS starting with 1.04 (that's
what, 8 or 10 years old?). This is true with all apps that can accept a
command line argument for the doc file to load (most of the availaable apps
will od that). The differnce, of course, is that Teradesk/GEM desk top are
free, and the WWW package is donationware.

5806. Petey the whine baby

Newsgroup: comp.sys.atari.advocacy
Date: 1996-10-14 00:00:00 UTC
From: Michael Grove <mgrove@ridgecrest.ca.us>
Message-ID: <3262F17A.40AE@ridgecrest.ca.us>
Source record: 8265

First, Petey complains that someone is
cancelling his post to the comp.sys.atari
newsgroups. It was nice while it lasted.
My system adminstrator recommends that we
elect a moderator for our newsgroups that
can "legally" cancel any unwanted messages
to these newsgroups. This would be through
the usenet bunch. I don't have any idea how
to do this, but someone (he,he,he) in our
newsgroup does know how. The question is would
they be willing to register with the usenet?

Secondly, my system adminstrator received
a complaint from Mr.Sinplop (and i'm not
quoting this, so it's ok for me to post it)
that I spammed his email with sixteen of the
same messages. I can see that Sinplop didn't
bother to read all of these. The emails consisted
of the recent post to the atari newsgroup concerning
something about new Apples (I actually didn't
read the 100k article as I do buy Mac
World). All I did was reply to his post and
quote the needlessly large article. Each mail
was unique, with different text, and a quote
of his original post for reference.
Now all I can say is that you might have some
idea of how the users in this group feel when
they have to download and read these articles
off line containing nothing but thousands of
wasted bits with you sorry arsed name attached to
the file.
But honestly, sixteen messages? I would never
have that much to say to you, Mr. Sinplop. Maybe
it was an error with my machine. It is a Mac you
know :)

Mike

An advocacy group with only Atari advocates would be booring! It'd
just be "I love Atari", "Yeah it's great", "I agree". You need someone
to aim your defence at.

The internet accessories that Viscorp's head of Software called not upto snuff.
Considering the $450 price does not include a HD. Can you get a 1200 in NA,
today? I don't think so..

The $450 Newton 120 is more capable of internet than the A1200.. Nice try..

I don't need to think so, I know you can get brand new A1200's. Try Devine Computers
or Software Hut. There's even a local dealer near where I live that has them.
You really need to take your head out of your ass and just take a peak around.
There's a whole "real" world out here.

Wow! You mean the PowerMac version of PhotoShop has features that the 68K version has not? Quite incorrect, it is just optimized for the PowerPC, much like Amiga software is often optimized for the 68060 or 040.

Why not? Have you got a lot of money invested in Dec hardware or
something? Will some part of you shrivel and die if it realizes that
there may be something that a Falcon can manage better than an alpha?

There are some very particular things that the Falcon is capable
of doing very well. There are also some things that it can do
extremely well if the task allows the proper use of it's onboard
56K DSP. It is in such tasks that a Falcon has managed to equal
an alpha.

Until you can even manage a point by point comparison of ClarisWorks
and MSWord, you aren't even really justified in calling them un-
comparable. You can't even compare these two rather mundane packages
in any meaningful sense let alone anything else.

Yeah, on a PC with Win95 you NEED the speed.
Anyway, SCALA runs circles around Powerpoint when it comes to smooth presentations. M$ sucks big time. A p133 with 16megs and a S3-trio 64 PCI GFX card and WIn95....hmmmm....After I gave a demo with Scala the audience went completely wild. "Wow, that must be a FAST computer......"
Yeah, 14mhz 68020 and an AGA chipset......

Ah well, who cares.....I am happy....They weren't....That's what counts!

....And back they went to the rest of the crowd, trying to squeeze some more out of their Win95 machines.....

HAROLD

List of them, please?

For those unaware, CyberDog is a set of slow, buggy, incomplete Internet e-mail and web browser apps, with a browser slower and less capable than CAB. It's sole claim to fame is its ability to interface with OpenDoc. WWW141 is more capable - but it's free.

I have never used an Amiga, owned an Amiga, or had any interest in an Amiga.
And I decided to test the validity of Petey's statement about inavailablity
of them. I walked down to Barnes and Noble, grabbed one of the Amiga rags,
and called some of the mail-order companies in them (the same method that
one has to use to get Mac equipment). Not only was Amiga equipment and systems
available, it was considerably cheaper and easier to purchase and buy than
Mac stuff. And the salespeople had a clue about what they sell, unlike
most of the Mac sellers.

More proof that Mr. Sinclair is a do-nothing know-nothing.

Why shouldn't it be? The 680x0 line has always been ahead of the
80x86 line. Are you suggesting that the company that produces the
core logic for your very dear machine has somehow faltered? In the
same breath you tear down the 68060, you tear down the PPC604 as well.
As always you do so without the slightest information.

Admittedly, my views are merely the extension of the expectations
provided by the rest of the 68K family. However, such expectations are
required to give the PPC's any legitimacy. For both reflect upon the
same company, and in the end each other.

You may try to prove me wrong any time you are up to posting more
than just empty rhetoric.

OK, Peter, you had your chance. Now, here's the bottom line: Within the past
week, you posted a comemrcial advertisement here, in direct violation of the
charter of University of Northern Iowa. You placed your university's status
as a non-profit educational institution in dnager. You have alos refused to
stop posting personal attacks, even though I offered the olive branch and
suggested that a sharing of knowledge would be more productive than the
constant flames that your activities have generated in the past.

Now here's what's going to happen: EVERY user who is tired of your crap is
going to send email to postmaster@uni.com, quoting the entire following
section, and explaining that commercial advertising is a violation of the
university's charter and endangers their tax-free status. If your sysadmin
still refuses to curb your activities, then the /real/ university
adminstration can take it up with the IRS.

The following is the message that will end the career of Peter Sinclair-Day,
Macintosh salesman:

Introducing the MPOWER line of Mac OS compatible personal
When we asked our customers what they wanted in an Apple Macintosh compatible clone computer, we weren't surprised to hear that most of them wanted two things: great performance at a great price, and the ability to order the system they want, with the drives, and other options they need, but without a bunch of "features" they neither need nor want. The APS MPower series of personal computers is designed to accommodate both of these requests. Priced hundreds of dollars less than systems with similar performance and features, APS MPower systems deliver the exceptional performance of Motorola's 603e and 604e PowerPC processors. APS MPower systems offer a staggering array of storage and peripheral options - and why not. APS Technologies is the premier supplier of storage and backup products to the Macintosh market. Our "Build Your Own Box" option lets you configure your own system with an astounding amount of flexibility.

The Best Engineering - Motorola

When we asked our customers what they wanted in an Apple Macintosh
* Motorola - manufacturer of the PowerPC processor &endash; no one knows it better
* MPower takes advantage of Motorola's quality processor technology, innovation & reliability

The Best Service and Support

* MPower comes from the company you've known and trusted for years
* MPower has the backing of APS' award-winning service and support

Exceptional Value

* Best mix of advanced processor technology and high-quality
Whenhardwared our customers what they wanted in an Apple Macintosh
* Compared with other personal computers running Mac OS, APS' MPower gives you the most for your money

Most Configuration Options

* APS, the recognized leader in Mac data storage solutions, has the hardware that you want included with your next Mac OS system - hard drives, removable media devices, and tape backup systems

APS MPOWER 603E160 $1399
Wh* The best value in PowerPC computing!nted in an Apple Macintosh
* 160MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays
* 1.2GB hard drive
5
* 8X CD-ROM

* Monitor sold seperately

The new benchmark in PowerPC, Mac OS computing, the APS MPower 603e160, for under $1,400, is the value leader in RISC-based workstations. The perfect home, or mass application PowerPC computer includes a 1.2GB hard disk drive, an 8X CD-ROM, and 16MB (upgradable to 160MB) of RAM. The APS MPower 603e160 includes a mouse, ADBtosh keyboard, three PCI expansion slots, and two available 3.5" drive bays. One-year limited warranty.

APS MPOWER 603E200 $1599
* The ideal mix of performance and value
* 200MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays
* 1.2GB hard drive
* 8X CD-ROM

* Monitor sold seperately

7
Outstanding performance at a terrific price, the APS MPower 603e200 is the bang-for-the-buck system of choice for individual and institutional users alike. Powered by Motorola's 200MHz PowerPC 603e processor, the APS MPower 603e200 comes ready for action with a 1.2GB hard drive and an 8X CD-ROM. Run most applications in the installed 16MB of system RAM (upgradable to 160MB) and enjoy the exceptional performance afforded by the 256KB of Level 2 cache and 1MB of VRAM. Three PCI slots and two available 3.5" drive bays let you add a whole range of PCI card and peripheral options. With the included mouse and extended ADB keyboard, this is the value-priced performance system of choice. One-year limited warranty.

APS MPOWER 604E200 $2599
* High-performance mini-tower PowerPC system at an exceptional price
* Blazing fast 200MHz PowerPC 604e processor
* Five PCI slots and four available drive bays

* 2.5GB hard drive
* 8X CD-ROM
* 24MB of RAM

* Monitor sold seperately

Blinding speed and exceptional value set this high-performance PowerPC, Mac OS workstation firmly at the top of the heap. The APS MPower 604e200 comes equipped with a gigantic 2.5GB hard disk drive, an 8X CD-ROM drive, and 24MB of RAM (upgradable to 160MB of EDO DIMM RAM) - and that's just for starters! Turbocharged with 2MB of VRAM and 512K of Level 2 cache, the APS MPower 604e200 includes five PCI slots for video, networking, peripheral expansion, and other PCI-based cards. The roomy mini-tower design includes four available drive bays for optimal customization of the high-performance MPower 604e200. One-year limited warranty.

<See dejanews for details>

In the first place, Glen, I never stated the clock speed of the Alpha - in fact, I have no idea what speed it was running. However, the evidence is available for anyone who is interested in the truth, rather than MCIBTYC posturing; the demo in question took place at a largish computer show in Germany in, I believe, 1992. The reason the Falcon outperformed the DEC is that the Flacon's design is optimized for multimedia; the DEC box was optimized as a file serve, which is a usually a poor configuration for MM apps.

So, if you want the truth, go look it up. If, on the other hand, all you care about is starting more flame wars - go to Hell, I can't be bothered.

In addition to that, Oregon Research happens to be a few blocks from my
apartment - they stock and sell software for both Atari and Amiga, and I'd bet
a nickel I could buy an Amiga from them, as well.

The point is moot, now that sinclap has jeopardized his uni's tax status,
however...

So, you actually ordered from these Amiga mailorder firms? Did you order from
Safe Harbor or Software Hut. Thats interesting, I had a different negative
experience when I ordered from Software Hut. My A1200 arrived banged up in a
mangled box and took for ever to replace.

Did you actually order or are you talking out of your ass?

So you ordered from Mac mailorders before? I never had difficulties with the
big three...MacZone, MacWareHouse and MacConnection. Order before 12am, and
recieve it the next day for $3(software)... There are Mac mailorder dogs such
as CompuD...

Interesting I had the opposite experience and I am a Mac owner and was an Amiga
nut at one time. I still have a heart for the Amiga and was a swell machine in
it's time. I am keeping my eye on the BeBox and the OS. If there are cool apps
within the year, who knows.

I wasn't aware that the Amigas were cheaper than the Macs and Pentiums.. The
only Amiga available in NA is the $2800 040-25mhz A4000T new. Apple doesn't
make 040 Macs today...So, why did you state the Amiga is cheaper. In many
categories of software there is no Amiga equivelants.

I remember that! The Atari group watched the demo that the Alpha team
were doing and upstaged them by running the same demo on the Falcon but
faster!!! Its the truth! Righteous!!! :)

Ever heard of QuickPak? There are various places in North America that
you can get the A1200 (new) and for as low as $450.00...Cheer up, though
maybe you'll get something right -one- of these days... :)

> internet suite and Apple's video file format for?

See my other message about Cyberdog. It is not a megolithic suite.

QuickTime is not a video file format. QuickTime "movies" can contain text, graphics, sound, music, full motion video, VR panoramas, and 3-D objects. QuickTime VR is a subset of QuickTime for displaying VR "panoramas" -- you can look at a photorealistic scene, and rotate 360 degrees, around, up and down. Every major Mac developer supports QuickTime. Many if not most multimedia CD-ROMs are QuickTime-based. Sun Microsystems and Netscape both use QuickTime, as well as SGI if I'm not mistaken. (I'm not sure about SGI, but I believe I read it somewhere.)

> Until you can even manage a point by point comparison of ClarisWorks
> and MSWord, you aren't even really justified in calling them un-
> comparable. You can't even compare these two rather mundane packages
> in any meaningful sense let alone anything else.

Some features that Microsoft Word has that ClarisWorks does not:
* Automatically corrects spelling and typographical errors as you type
* Can automatically format your document
* Can be automated with its WordBasic scripting language, which is more complex than ClarisWorks' simple macro facility
* has 100-level "Undo"
* has an annotation system
* has a revision-tracking system to track changes to documents
* has a grammar checker
* has automatic footnotes and endnotes
* has index and table-of-contents generation

There are more features that Microsoft Word has that ClarisWorks does not; I have not listed them all. Keep in mind that ClarisWorks is not intended to be a heavy-duty word processor like Word. ClarisWorks is an integrated program like Microsoft Works or Atari Works. Word is a dedicated word processing program.

Clearly, a word processing program that does not have automatic footnotes and endnotes, or index and TOC generation, couldn't be considered a high-end word processor. That's not to say that ClarisWorks is not good, or that it's not popular -- it's just that it's aimed at a different market from the one Word is aimed at.

> internet app.
> Cyberdog = Apple Navigator or Apple Explorer.

Actually, Cyberdog is not a monothilic Internet application. It is not an application at all. It is a collection of OpenDoc parts. An OpenDoc part is a small, self-contained module that does one specific task. For example, Cyberdog is made of separate OpenDoc parts -- a mail reader, news reader, web browser, and so on. Because each OpenDoc part is self-contained, they can be replaced without affecting the other parts. For example, Netscape is working on their own web browser part which you could use to replace Cyberdog's web browser part if you want. Anyone can replace any part with any other part that does the same thing, and they will all still work with each other seamlessly.

The idea behind OpenDoc is that instead of companies building monolithic applications that do everything, companies write small parts that do one specific task very well. Because OpenDoc parts all share data and interact with each other seamlessly, you can build your perfect tool! You can buy a text editor part from one company, a spell-checking part from another, a grammar-checking part from a thid, a drawing part from a fourth -- instead of buying one monolithic application that does everything, but may not do everything the way you like it. It allows for much more freedom.

For example, you could use an OpenDoc FTP part to embed a picture from the Internet into a word processing document. Imagine a spreadsheet that is linked to a gopher server via a gopher part -- it could fetch data from the internet and update the spreadsheet automatically.

What's even better, OpenDoc is cross platform. It is an open standard that is not controlled by any one company, and the source code can be licensed and ported to any platform, even Atari.

It's a pretty strong claim to state that the 68060 is comparable in speed
to the Pentium Pro and PowerPC 604. Do you have any hard evidence to back
that up?

One doesn't have to believe that Motorola (who incidentally wasn't the
only company involved in the design of the PowerPC) has somehow faltered.
Consider the fact that the 68060 is much older than the Pentium Pro and
PowerPC 604; it was released shortly after the Pentium was released. The
68060 was not designed to compete with the Pentium Pro or the PowerPC 604
because those two processors didn't exist when the design of the 68060 was
started.

> Admittedly, my views are merely the extension of the expectations
> provided by the rest of the 68K family. However, such expectations are
> required to give the PPC's any legitimacy. For both reflect upon the
> same company, and in the end each other.

Not necessarily. Lots of companies make products aimed at different markets.
There is not necessarily any connection between the PPC and the 68060,
especially since the PPC was a co-operative effort between Apple, IBM, and
Motorola. For example, lots of computer companies make low-end and high-end
computers. Just because company A's low-end PC isn't as powerful as company
B's high-end PC, does that mean that company A's *high-end* PC is somehow
not as powerful?

You're in effect saying that it would be hard for you to believe that the
PPC604 is as fast as the Pentium Pro if the 68060 is not. But the 68060
is older than the PPC604 or the Pentium Pro. And of course lots of companies
make products of varying levels of power -- one doesn't have to design
all the products one makes to be as powerful as possible, simply because
there is often a huge tradeoff between power and cost.

Another possible explanation was that Motorola didn't want to spend too much money on an architecture that it knew was soon going to be left by the wayside. Intel is a very large company with large sales and a lot of money. The signs that Apple was looking for new processor technology had been around for a while, and Motorola must have known that Apple would move away from the 68000-series. (Heck, it was in the alliance with them that designed the PPC!) If they knew that there largest customer would eventually abandon them, why would they try to concentrate on making the 68060 as powerful as the Pentium Pro (which didn't exist at the time) when they knew the market for this chip would be in the embedded controller market and not the home PC market?

I have a lab full of fast PEntium and Pentium Pro systems. $2800 for one of
the cheaper ones would be a real bargain. The majority of them run from $4000
to $50k - and most of them have plain VGA cards with DRAM.

Yes, but for how much money?

"Open" standards that cost large amounts of up-front cash don't become
standards. Quick example: MicroChannel Architecture. Instead, EISA became
the defacto standard - it was a /free/ open standard. IBM eventually
abandoned MCA because no one would pay them for the license.

The 060 is a 2nd generation extension of the 68K line which has
always been in direct competition with and exceeded the 80x86 line.
Despite it's name, the P6 is just the 2nd generation extension of the
80x86 line. If the P6 can compare well to a PPC604 than so should an

060. Either that or they should have named it an 680S40 or somesuch.

The 68K line was never low end by any stretch of the imagination.
That it suddenly becomes so is an interesting convolution of history.
Should they want to break with that history, they should be very
explicit about it. There should be no doubt that the family is no
longer following the progression that it once did from 68K->68020->
68030->68040. Anything else is just cheap, bait and switch marketing.
It should no more be tolerated from Motorola than it should be
tolerated from Cyrix or AMD. As their 'baits' stain them so do
Motorola's 'baits' stain it.

If you like buying from people who lie to you: so be it.

However, the only one who ever established any real information
on the performance of these chips indicated that indeed 060's
and 686's are comparable.

Either this is the case, or motorola is intentionally misleading the
buying public with thier naming schemes. If this cannot be taken at
face value, it is a bad reflection upon motorola and anything they
make (especially in this domain) including PPC's.

Sauce for the goose is sauce for the gander.

Sounds kinda like pluggins. So what makes this any different from the
IRC, mail and news ActiveX controls/plugins that come with IE3.

Furthermore, if it's not some monolithic thing then why is it being
referenced as such? Unix has had internet functionality broken into
many small self contained parts for years. That is nothing new.

No, they're not like desk accessories at all. Desk accessories are not object-oriented modules in the way that OpenDoc parts are. OpenDoc parts can be embedded in each other. You can embed any OpenDoc part into any other OpenDoc part -- for example, you can embed an internet link into a spreadsheet, a drawing into a word processor, a rotating 3-D animation into a painting, and so on. No part has to know anything about any other type of data other than the one it handles. This is very different from desk acessories. You can't embed one desk accessory into another.

The tools that allow developers to create and test their own OpenDoc parts are available for free, so there is no cost to develop OpenDoc parts. Component Integration Labs, the non-profit corporation that controls OpenDoc, has over 3000 members, including companies such as Netscape, Apple, IBM, Sun, Novell, Oracle, and Adobe. Membership in CI Labs is $350 a year (There are levels of membership that cost more, but offer more benefits.) Members receive source code and a perpetual licence.

OpenDoc is out now for Mac and OS/2, and AIX, Windows NT, and Windows 95 versions are in beta. If I'm not mistaken, Sun is porting OpenDoc to Solaris. Many companies have announced their intention to create OpenDoc parts. Learn more about OpenDoc at http://opendoc.apple.com/ and

So either the Atari team coded better or the hardware was better,
but the end-result is the same...the Atari version was faster.
Keep in mind that this was a spur-of-the-moment response to a
demo they saw on a supposedly superior machine! I'll take the
Alpha teams' response to it as testimony--they were infuriated!

Try $2600 with a 17" monitor, 200Mhz P5, 32Meg Ram, high end
video and all the other multimedia baubles.

Your lab was robbed.

$4000 will get you that silly Gateway with the 31" monitor...
...or a reasonably priced clone and a big CAD monitor.

I always hated those auto correctors...

On a personal note, my mother asked for consultation on this
subject last night. For some reason she has MS Word 6 on the
brain. You can imagine her horror when I told her what kind of
machine she would need to run the beast and how much it would
cost her. Then, I coaxed out of her what her actual requirements
were.

After this, I just recommended she use the editor built into
windows: Write.

Don't forget that the Atari ST was THE concept machine for the '80's. GEM was the brainchild of Gary Kildale of Digital Research Inc. If you remember, GEM was written for the PC. Of all the GUI's (this includes the PARC machine, Apple's Mac and Amiga, GEM for the Atari was the most elegant. It analogized the "office" (file drawers, folders, etc.) the best. If you find fault with GEM, then you didn't like Gary's (DRI's) vision.

I am glad that I bought that ST back in '85 instead of the Mac or Amiga. Those are fine machines, they just were Steve Jobs and Jay Miner's visions. If you were to compare side-by-side, you would see what I mean. My kids needed no help with the Atari. It just ran. Now you could find fault with TOS (written in C - not as fast as it could have been) and that is fine. But the machine was fine (and still is for what we ask of it).

So .. do really like your Mac or PC or whatever? Does it do what you ask of it?

> 68060 80686/PPro PPC604

Your comparisons of later 68k and x86 members is fairly true, however, the earlier models are inaccurately linked.

The 68000 is a 16/32 CPU, whereas the 8086 is an 8/16 CPU. A better match for the 68000 would have been the 386SX (which is also a 16/32 CPU). It also has a 24-bit address size, so it can address up to 16 Mbytes of RAM, whereas the the 8086 can only see 1Mbyte (20-bits wide). The 386SX also has this 24-bit (16 Mbyte) memory range.

The 68020 is a full 32-bit (32/32) CPU, not a 16-bit (16/16) CPU like the 286. It should be ranked about equal with the 32-bit (32/32) 386DX.

(BTW: For those of you who may not understand what I mean by "16/32", and other such items in my text: it refers to data bus size of the individual CPU. The first number refers to the CPU-to-world data bus, whereas the second refers to the on-chip data paths).

Unless the Atari group used the same algorithm as the Alpha team, it doesn't
really prove anything. If it was an optimization fo the algorithm that was
responsible for the increase in speed, then the Alpha team can just as easily
use that algorithm to speed up their demo.

Unless we can control the algorithm, we can't be sure whether the increase
in speed is due to the hardware or the algorithm. If we aren't sure that the
alogrithm is the same then the demonstration doesn't *necessarily* prove
anything.

> You have no idea whatsoever what you're talking about.

Maybe not, but in this case, at least, he makes sense. The Falcon030 is certainly not as powerful as the TT030, is it? And he is quite correct about where the PPC came from. What he neglects to mention is that it's next (or should I say NeXT?) to impossible to find native-mode apps for the PPC; running in emulation mode naturally reduces performance.

Raw "horsepower" of a computer isn't relevant to the end user, however; what matters is how efficiently the OS and applications /use/ that horsepower. As an analogy, if you owned both a Mercury station wagon, and a shuttle transporter (the device that carries the shuttle from the Vehicle Assembly Building to the launch pad), you would find it far more rewarding to drive the Merc to Safeway to buy a gallon of milk; the shuttle transporter is arguably the most powerful land vehcile in the world, but it has a top speed of about 2 miles an hour. It wasn't designed for trips to the corner store, and the Merc can't carry the shuttle to the launch pad. In the same way, a multi-processor Pentium Pro 200 makes a terrific file server - but it's clumsy and awkward for MIDI applications on the road.

Get the computer that does what you want, for as little money as you can manage to spend, and offers the minimum required features. There will be a new one next year that does it better and cheaper, anyhow - even in the Atari world. The difference is, in the Atari world, you'll be buying something designed by people who love their platform, and use it themselves in preference to other platforms. The same may probably be said for the Amiga. Everyone else is in it for the money, and little else.

If he has violated their AUP or whatever then fair enough but I for
one find it pretty sad that you want to get rid of him, he's never
put up a single decent argument against anything and although you may
find him irritating the fact is that none of the postings in this
group would be here without him. I've taken this group for about 6
months and can never recall a posting that was not connected to Pete,
and if they did exist then you could probably count them on one hand.
I know you object to his postings but if you don't like them then you
can probably kill them, I quite enjoy his postings it's very
interesting to see how some peoples mind works (or not in this case).
Wether you like it or not Pete IS the group.

...but that's not what we're comparing...

Even so, neither one of those machines outclasses the other quite
in the manner Petey-Boy would imply a PPC outclasses an 060.
Furthermore, Petey-Boy asserts that an 060 cannot compete with a
PPC merely because of what it is ignoring the tests that say other-
wise and offering no reason for us to believe that an 060 wouldn't
toast a PPC, especially his. In fact, if the 060 specs on mot's
homepage are to believed, the T60 under discussion should be, at
a minimum, twice as fast as Petey-Boy's PowerMac.

This is a conservative estimate, presuming that the 060 is just a
souped up 040. If that is not the case, then the 060 would be a bit
more powerful and quite able to compare to 686's and 604's.

Considering that it's a superscalar cpu with branch caching
and executes 3 instructions per clock, such comparisons are not
at all wild. At the VERY least it should be able to keep up
with a 120Mhz 601 or P5. Eliminate OS overhead inherent in
Mac/PC's the minimal performance of an 060/66 should be quite
a bit better than even that.

It is motorola hardware after all...

Some just know how to use it more efficiently.
Some things never change... '-p

You said that $2800 would be a real bargain with plain DRAM VGA
and that the majority were $4000 and up. You didn't mention the
server. I presume that there are not a plethora for that would
rather defeat the point...

Even so, one can get a server system with a 200Mhz P6, 64 Megs
of RAM, 4 Gig HD and Fast UltraWide SCSI for $3200. This includes
the multimedia baubles. Leave out the Multimedia baubles and it
would still come in at around $2600...

>
>> Your lab was robbed.
>
>Hardly. We get the stuff at cost. The retail prices are what I mentioned
>above.

Oddly enough, they seem to have disappeared. One is hard pressed
to find PC's in your 'average' price range. One is especially
hard pressed to find mere Pentia in that range. All I could find
in that range were SMP P6's. If you really need that much horse
power for your servers, you're looking in the wrong stables.

I really don't know where you're finding these 50K systems.
The most expensive PC I found was $7200, was a Dual 200Mhz P6,
with 128Megs RAM, 9 Gig disk, 21" monitor & 12x CD.

[deletia]

Petey-Boy still doesn't and was bailed out by someone else.
This rescue does not negate my original criticism of him; it
re-enforces it. The original comparison was never addressed by
anything but rhetoric and a few passing comments by someone
!(an apple cheerleader).

It just spawned an interesting tangent.

Hmm...I can't say with certainty that line for line the code did the
same thing...HOWEVER, the end result was a demo on the Falcon that was
screen identical to the Alpha teams's demo and was faster...and it did
infuriate the Alpha team so much that they asked the show hosts to make
Atari stop displaying the demo...The nerve of that upstart Atari team
and their Falcon!!!

>The point I'm trying to make is that one can't claim with certainty that
>one machine is faster than the other until we ensure that all variables
>except the hardware are controlled. Otherwise, we can't be sure that the

I've never said that the Falcon was "faster" than a Dec Alpha or Pentium
or (fill in the blank here please)...The fact I'm trying to get across to
so many non-Atarians is that TOS/GEM systems running on hardware with
very nice custom chips (DSP, etc,) far outperforms the specs...(something
Atarians have known for years)... Thank you...

That wasn't misleading. TOS 3 actually came out before TOS 2.06 IIRC.
Tos 2.06 is TOS 3 without the few extra TT features, TOS 2.06 was an
optional upgrade whereas TOS 3 is only available with machines that
need it.

This is just an example, sure there may have been differences and the
like but the Alpha team obviously didn't seem to notice them. The
point is that it's not raw machine power that counts, it's the quality
of of the coding too. The 601 would surely wipe the floor with
something like the Falcon as far as raw number crunching goes but when
you actually start running full on apps, the difference is far less
marked.

Rich Tietjens <*atari@freemark.com*> wrote:
>>Some features that Microsoft Word has that ClarisWorks does not:
>>* Automatically corrects spelling and typographical errors as you type
>WordWriter ST, about 1985, I believe.
>>* Can automatically format your document
>Ditto.

That's not correct. WordWriter ST didn't even auto-wrap text if you inserted and deleted text in a paragraph; you had to press an F-key to get it to reformat. In any case, that's not the feature that I'm talking about in Microsoft Word. Word can automatically make a document fit a certain number of pages that you specify, by adjusting spacing, margins, and so on. It also will automatically apply indentation, styles, headings, and so on, which is probably different from what you're thinking. Not that WordWriter ST is relevant here.

>>* Can be automated with its WordBasic scripting language, which is more
>> complex than ClarisWorks' simple macro facility
>
>Yet another version of Visual Basic.

I was not making any judgement on Visual Basic. I was simply stating that it is more complex that ClarisWorks' macro facility, which it is. Clarisworks allows you to record a sequence of actions and play them back, but offers no programming features.

>>* has an annotation system
>I can't honestly say I've ever used that feature.

Your responses above re: automatic formatting, as well as your comment below about its revision tracking system, suggest that you might not be familiar with Word. Have you used it?

>>* has a revision-tracking system to track changes to documents
>
>For people who don't know how to "save as..."

Uh... not quite. Does using "Save as..." log changes to the document in one file, along with the dates the changes were made and by whom, for easy viewing?

>>* has automatic footnotes and endnotes
>
>Back to WordWriter.

What does WordWriter have to do with this comparison? I'm simply trying to show that MS Word and ClarisWorks are not comparable programs.

>>* has index and table-of-contents generation
>
>Useful for writing large papers and books, not much use for the home/personal
>writer.

I wasn't making any comments on how useful the features were for home or personal writers. I was simply detailing a list of some features that Word has that ClarisWorks does not.

>>There are more features that Microsoft Word has that ClarisWorks does not; I
>>have not listed them all. Keep in mind that ClarisWorks is not intended to

I'm not sure why you're bringing up Cyrix and AMD. What are the behaviours
that Cyrix and AMD are engaging in that Motorola is? This was probably in
an earlier article, and I've only been reading this newsgroup for a few days.

>>> Admittedly, my views are merely the extension of the expectations

I don't understand why you are stating that the PPC604 has to perform just
as well as the 68060. Companies make lots of products, and they're not
all released at the same time, nor are they all equal in power or performance.
I don't see any reason why the performance of the 68060 necessarily should
reflect on the performance of the PowerPC 604.

>>especially since the PPC was a co-operative effort between Apple, IBM, and
>>Motorola. For example, lots of computer companies make low-end and high-end

Did you consider it misleading of Atari that TOS 3.0x and TOS 2.0x were almost identical, except for TT support? O

Companies do this kind of naming chicanery all the time; it's not limited to any one company or corporation. Any why should what Motorola names its chips reflect on their engineering skill?

>cheap and easy as you seem to beleive.

Well VRAM isn't the only fast ram solution. You have the MDRAM of the
ET6000 cards which has an internal bandwidth of 720 MB/s, and the 2 meg
ET6000 cards can now be bought for less than US$150. The 4 meg cards
are coming out in a month or two, and the price of the 2 meggers will
drop even further. I had an ET6000 card a few months ago, and it
supported a sustained flow of 90 MB/s from the CPU. I had a directx app
writing 107 MB/s of 255-color software sprites with transparency to an
85 Hz screen double-buffered at 85 fps with z-ordering, and the math to
animate these sprites in real-motion type curves.

I've never seen an Amiga do anything like it. I've never seen an Amiga
do anything like direct3d, either. The other day I was watching
realtime ghourad shading on an 800*600 screen at 120 Hz, doublebuffered.
Makes TV look sick by comparison. Never seen anything like it on an
Amiga.

"Well can you record it to video with professional results?"

Why? It looks a hell of a lot better on the computer screen at
800*600@120Hz.

A good start would be http://quicktime.apple.com/. In there you should be able to find a link to the QuickTime FAQ, which should answer any questions you have about what QuickTime is and does. The Start Trek TNG Technical Manual is an example of an early product that used QuickTime VR. A version of Apple's 3D Metafile format has been adopted as an textension of VRML, if I'm not mistaken.

>>"panoramas" -- you can look at a photorealistic scene, and rotate 360

>>QuickTime. Many if not most multimedia CD-ROMs are QuickTime-based.
>>Sun Microsystems and Netscape both use QuickTime, as well as SGI if
>>I'm not mistaken. (I'm not sure about SGI, but I believe I read it
>>somewhere.)
>
> So what?

You asked who uses QuickTime, and what they use it for. My response was that many if not mose multimedia CD-ROMs are authored using QuickTime, and the Sun, SGI, and Netscape all use QuickTime. Do you not consider that to be a response to your question?

>[Tangent Deleted]

Actually it wasn't a tangent, it was a direct response to a question you made.

In response to a previous posting by someone else, you said:

>> Until you can even manage a point by point comparison of ClarisWorks
>> and MSWord, you aren't even really justified in calling them un-
>> comparable. You can't even compare these two rather mundane packages
>> in any meaningful sense let alone anything else.

To which I replied:

>Some features that Microsoft Word has that ClarisWorks does not:
>* Automatically corrects spelling and typographical errors as you type
>* Can automatically format your document

>* Can be automated with its WordBasic scripting language, which is more
> complex than ClarisWorks' simple macro facility
>* has 100-level "Undo"
>* has an annotation system
>* has a revision-tracking system to track changes to documents
>* has a grammar checker
>* has automatic footnotes and endnotes
>* has index and table-of-contents generation

I think this is a point-by-point comparison which shows that ClarisWorks and
MS Word are not comparable. Do you disagree? How come you consider this
a tangent; is it not a direct response to your statement?

> The rest of the planet calls this an application actually.

OK, you can call it an application if you want, but in this case the OpenDoc
people are trying to draw the distinction between monolithic do-everything-in
one-program applications and OpenDoc parts, which are tiny self-contained
modules that do only one specific task. If you don't like using parts of
Cyberdog, you can replace them with parts you don't like; you don't have to
use all or nothing.

>>Cyberdog is made of separate OpenDoc parts -- a mail reader, news reader,

ActiveX and the OLE technology on which it is based is a subset of OpenDoc.
OpenDoc-compatible software can work with OLE-compatible software. OpenDoc
is also regarded by many to be technically superior to OLE/ActiveX, and has
the further benefit of not being tainted by any questions of being proprietary.

> Furthermore, if it's not some monolithic thing then why is it being
> referenced as such? Unix has had internet functionality broken into
> many small self contained parts for years. That is nothing new.

Cyberdog was being referenced as a suite, which is what it is. It is a
collection of OpenDoc parts which are collectively given the name "Cyberdog."

My point exactly! Of course an advocacy must refer to other platforms
but that reference should be within the context of Atari machines,
otherwise you are in the wrong place.

> Alpha teams' response to it as testimony--they were infuriated!

If the Atari team coded their demo as a "spur-of-the-moment response to a demo" on the Alpha, then it's highly likely that the two programs didn't even do the same thing. Perhaps the Atari team's algoirthm was the same, but they performed fewer iterations. Perhaps the Atari team's algorithm was slightly faster and they performed fewer iterations. Probably the graphics resolution and colour depth were different.

The point I'm trying to make is that one can't claim with certainty that one machine is faster than the other until we ensure that all variables except the hardware are controlled. Otherwise, we can't be sure that the differences in performance are due to the hardware rather than the software.

Which is still not a suitable file server.

And it's not relevant to Atari, either.

That's not true. Almost every application out there is available in both
68K and PPC-native form. There's even software that *requires* a PowerPC.

Style sheets is a feature that was not included , WWST, that's true. OTOH, in
all the years I've been using 'puters, I've never needed a style sheet - I'm
not a professional writer, I'm a software developer and lab tech.

IIRC, the person who made that statement is a well-known clueless lUser.

Claris is a nice suite - I prefer it to anything MS ever released.
Comparability is only applicable if one NEEDS certain features that are in one
package, and not in another. For an addtional quick example, Pagestream does
everything I need in a DTP package, but Calamus SL is a far more powerful
package. The difference between $40 and $400 is significant, however, at
least to me.

I'm pretty sure. I used WordWriter for years. You had to use the "Reformat
paragraph" or "Reformat Document" commands. I later swtiched to Calligrapher,
which had quirks of its own.

>> In any case, that's not the feature that I'm talking about in

Um, it's not the same as style sheets. And the fact that you do not use
a style sheet doesn't mean that it's not useful to a lot of people, or that
auto-formatting is a not a feature that Word has that ClarisWorks doesn't.

>>>>* has a revision-tracking system to track changes to documents

Just because you don't use it doesn't mean that it's no an important feature
for other people, or that it's "for people who don't know how to use Save As."

>>>>* has automatic footnotes and endnotes
>>>
```

>>>Back to WordWriter.

The topic was appropriate. Someone said that comparing Photoshop to PhotoLite
was like comparing MS Word to Clarisworks. Another person responded saying
that he was unjustified in saying that Word and Clarisworks are uncomparable.
I showed that they are uncomparable, as you agree.

>>>>* has index and table-of-contents generation
>>>
>>>Useful for writing large papers and books, not much use for the

>
>And I was commenting on how useful the features are. It's complementary to
>your feature-by-feature review.

Note that useful to you and useful are not necessarily the same. Lots of
professional writers, and many others, find index and table-of-contents
generation invaluable. There are lots of programs that I have that contain
stuff that I don't use, or don't use often. That doesn't mean they're not
useful, just that they're not useful *to me*. I'm sure there are features
and programs that you use that others don't find useful. That doesn't mean
that they are not useful features... remember that people have different
requirements and needs.

>>That's the only point I was trying to make, in response to someone's
>statement
>>that a previous poster had no basis for stating that ClarisWorks is not

>
>IIRC, the person who made that statement is a well-known clueless lUser.

I don't know who it was, nor does it make any difference to the claim that
Word and ClarisWorks are not comparable.

>Claris is a nice suite - I prefer it to anything MS ever released.
>Comparability is only applicable if one NEEDS certain features that are in one

I think the argument was that it would be unfair to compare two programs such as Word and Clarisworks by saying "Word takes longer to load than Clarisworks, so Clarisworks must be the better word processor." Lots of people like ClarisWorks and use it, but that doesn't mean that Word is not useful or is not good just because it's bigger and/or takes more time to load. It doesn't matter if ClarisWorks loads faster if it can't do something you need.

Your ignorance indicates fairly well that you have no business attempting
to inform anyone upon this subject.

BTW, the 060 is in fact a superscalar cpu with 3 execution paths.
So it does compare actually...

Is that really the best you can do? Besides, apple's sites are the
absolute slowest sites on the net. They're not useful for anything
even assuming they do contain any content. The sloth of apple sites
show the genuine uselessness of highbandwidth file formats on the net.

I was thinking more of somone like DEC or Siemans or McDonald-Douglas
or some ministry in thailand or whatnot.

No one expected any different. No one had any reason to expect any
difference. Furthermore, it is a domain which has no engineering
to speak of. Hardware is an entirely different matter. ISO9001 isn't
such a bold thing.

Either they compare (060 & P6), or Motorola gets a nice spot beside
Cyrix on the wall of shame.

> such a bold thing.

Hold on -- are you saying that:

(1) If Motorola calls it the 68060, but it's really not as powerful as a jump
from 040 to 060 might suggest, then that's misleading of Motorola

and at the same time that

(2) When Atari jumps from 2.0x to 3.0x it doesn't matter (ie, it's not as
misleading) because nobody expected any different?

Doesn't that seem unfair, to hold one company up to a standard you do not
hold another company up to?

As for your comments about software being a domain without any engineering
to speak of, I would have to disagree. Anyone who works in a serious
software/programming operation could tell you that engineering methods are
```

applied to software all the time. In fact, it's called "software engineering."

As for ISO9001, I work for a company that complies with ISO9001, and I can tell you for a fact that ISO9001 has nothing to say about the naming of products and whether or not they are misleading. ISO9001 can be summed up simply as:

(1) Say what you do.
(2) Do what you say.
(3) Document any discrepancies between (1) and (2)
(4) Act on the difference outlined in (3)

Of course, in reality it's really not quite that simple. I hope you're not suggesting that a 68060 that doesn't compare to the P6 could result in Motorola losing ISO certification.

The difference between small applications and OpenDoc parts is that the parts can all be embedded in each other, the parts all share the same interface. The parts are designed to work seamlessly with each other, and this is not necessarily the case with "small" applications.

>>OpenDoc-compatible software can work with OLE-compatible software. OpenDoc

If you use OLE or OpenDoc, you don't have to worry about losing information (formatting information, for example, like when you copy from a spreadsheet to a word processor and lose formatting information).

Your statement shows that I haven't been clear. You are not "using the word processor as a demented form of spreadsheet," you are using the spreadsheet part; you just have embedded the part into the word processing document. You don't have to switch to another application, you don't have to worry about a different program with a different interface. And you can embed any kind of data into any other kind of document you want; interoperability is assured.

This is true. However, according to Motorola's web site, the 68060 is
available in three speeds, the maximum being 66MHz.
(See http://www.mot.com/SPS/HPESD/prod/0X0/68060.html)

> a bit better than even that.

The PowerPC 601 can issue and retire three instructions per clock. That means that a 120MHz 601 can execute 360 MIPS. A 68060 can also execute three instructions per clock. That means that a 66MHz 68060 can execute 198MIPS. The PowerPC 601 has a 32K onboard cache. The 68060 has a 16K onboard cache. In addition, the PowerPC 601 has a 64-bit data bus, in contrast to the 68060's 32-bit data bus. These would all seem to suggest that a 120MHz 601 has an advantage over a 66MHz 68060.

If Motorola could make a 68060 at 66MHz run as fast as a 601 does at 120MHz, wouldn't it stand to reason that they would have put everything that made the 68060 super-fast into the 601? Why would Motorola make the 68060 so much faster with respect to clock speed than the PowerPC?

The PowerPC 604, which was mentioned earlier in this thread, can issue four instructions per clock, which would mean that a 604 at 120MHz can execute 480MIPS. The 604e, the succesor to the 604, has a 64K onboard cache.

> It is motorola hardware after all...

The PowerPC is also Motorola hardware! Earlier you were arguing that the performance of the 68060 would reflect on the PowerPC, since they're both made by the company. If the PowerPC is so inefficient that, at almost twice the clock speed of the 68060, it runs just as fast, wouldn't that also reflect badly on Motorola? If it works one way (68060 -> PPC) then why shouldn't it work the other way? (PPC -> 68060?)

No. For an example of some sites that use QuickTime VR (of course, you'll
nead the QuickTime VR plug-in for your browser) go to the following URL:
<http://qtvr.quicktime.apple.com/sam/saminet.html>, which contains links to
just a few (about four dozen) of the estimated thousands of sites that are
QTVR-enhanced.

For another example of a site which uses a lot of cool stuff (including QTVR
for a tour of their studio) visit <http://www.bluewaters.com/> Check out
Conagious InterActive's QuickTime showcase site for another example of what
QUickTime can do. It's at <http://www.contagious.com/qt/>. Also try out
<http://www.MediaCity.com/~erweb/>. These are some starting points that have
lots of neat QuickTime stuff.

I don't know whether you have access to a PC or Mac running a browser which
can handle Netscape Plug-ins. If not, you won't be able to see the neat
stuff on those sites.

> I was thinking more of somone like DEC or Siemans or McDonald-Douglas
> or some ministry in thailand or whatnot.

Some of the links include the city of Oxford, U of Texas, U of Philadelphia,
the US Space Camp, Toyota, Time Magazine, San Francisco Giants, MCA/Universal
Studios, Japan Airlines, Fox Studio, General Electric, Disney, AT&T, and BMW.

Myst, Havoc, ST:TNG Technical Manual are all examples of excellent games that
use QuickTime and its cousins. (As are the sites above, which use QT & QTVR.)
As for Cyberstudio, I'm not familiar with it. Does it encompass VR, 3D,
music, text, and sound? Even if it does (and I'm not saying it doesn't)
it still doesn't have the benefit of being the de facto standard in
multimedia presentation and authoring.

[more stuff about Cyberstudio deleted]

Isn't the PowerPC based on IBM's RIO chipset, except some instructions
were left out and it's a single chip CPU now? I know Motorola produces
it, and I think they use the memory bus from one of their older RISC
series for it, but I always thought it was an IBM made architecture.

Am I all wrong about this?

You've engaged in some creative deletion here, which is disingenuous.

In the original message, I said:

>QuickTime is not a video file format. QuickTime "movies" can contain
>text, graphics, sound, music, full motion video, VR panoramas, and 3-D
>objects. QuickTime VR is a subset of QuickTime for displaying VR

to which you responded:

> Then show me an URL where all these nifty toys are used and then
> tell me who uses them and how.

I replied with the following:

>A good start would be http://quicktime.apple.com/. In there you should be
>able to find a link to the QuickTime FAQ, which should answer any questions
>you have about what QuickTime is and does. The Start Trek TNG Technical
>Manual is an example of an early product that used QuickTime VR. A version
>of Apple's 3D Metafile format has been adopted as an textension of VRML, if
>I'm not mistaken.
```

but when you replied to that message, you only quoted the first line, and
then accused me of not answering your entire question;

>>A good start would be http://quicktime.apple.com/. In there you should be
>
> Is that really the best you can do? Besides, apple's sites are the
> absolute slowest sites on the net. They're not useful for anything
> even assuming they do contain any content. The sloth of apple sites
> show the genuine uselessness of highbandwidth file formats on the net.
>
> I was thinking more of somone like DEC or Siemans or McDonald-Douglas
> or some ministry in thailand or whatnot.
>
>[didn't address my question, got deleted]

Didn't I say that the ST:TNG Technical Manual was an early product that used
QTVR, and that Apple's 3D metafile format was adopted as an extension of
VRML? Aren't those two examples of what QuickTime and QuickTime VR are being
used for? How does this not address your question?

And then, at the bottom of the message, you clip an entire response from me,
like this:

>>>[Tangent Deleted]
>>
>[Tangent^2 Deleted]

Why did you clip it when it was a clear response to your challenge to compare
Word and ClarisWorks, and not a tangent at all?

>What on? On an 680x0 Amiga? *chuckle*

There are very few apps which are PowerMac only (more games and the like).
Most come as FAT binary or in two versions.
68k apps ARE nearly as fast as on a PowerMac which must emulate the 68k
processor.

5907. 10 Reasons To Use an Atari instead of a Macintosh

Newsgroup: comp.sys.atari.advocacy
Date: 1996-10-18 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <96292.113851STIRRE31@MAINE.MAINE.EDU>
Source record: 8066

1. Preemptive multitasking
2. The system takes up less than three megs on Atari computers
3. The Atari gives users more control
4. There are numerous cheap alternatives for software
5. One does not have to allocate memory for every app
6. Most everything is faster on the Atari computer
7. Small applications
8. The Atari operating system is more intuitive
9. Separate programs replace resource grabbing extensions
10. The Atari crashes much less frequently

These are some of my observations having bought a Macintosh to replace my Falcon. I am not saying I hate Macintosh or attacking it but simply pointing out some advantages of the computer I like which is rare in this group.

```

This is the main gist of the ISO9001 standard, actually, as stated
by the auditors themselves.

ISO9001: if(crap(today)) crap(tomorrow);
if(quality(today)) quality(tomorrow);

Motorola would be breaking 10 years of product history if they
belong on the wall of shame. That inconsistency is the relevant
part. Furthermore, Atari was already on the wall with Cyrix. I've
been berating them in these parts for various things probably before
you even touched a keyboard. Atarian's no longer naively believe in
the corporation that spawned their machine, unlike some brands of
cheerleader...

>
>As for your comments about software being a domain without any engineering
>to speak of, I would have to disagree. Anyone who works in a serious
>software/programming operation could tell you that engineering methods are

These are rather feeble attempts by some in the industry to avoid
the uncomfortable realization that computing is an immature discipline.
To presume to compare what gets passed off as software engineering
as something remotely equivalent to any other form of engineering
shows a fundemental misunderstanding of those disciplines. It also
grievously insults them at the same time. It also contradicts reality
and is especially laughable to those of us in the quality field.
We know better.

Yes, but I can do that already and I don't even need an inter-
operability standard beyond a win style clipboard. You've not
yet described anything that I have not yet been able to do
perfectly well without an interop uber-api.

The same applies to cyberdog. It has not yet been shown to be worth
our while.

>(See http://www.mot.com/SPS/HPESD/prod/0X0/68060.html)

Precisely. This makes it the approximate of a 198Mhz 68040.
Presuming that 040 & 486 performance are roughly equal, this
makes it the equivalent of a 200Mhz 486 or a 125Mhz Pentium.
125Mhz Pentium although rather slow by current bleeding edge
standards is more than fast enough to toast quite a few PowerMacs
including the one Petey-Boy owns. And this is just the lowerbound
estimate...

It is, however, consistent with what observations can
actually be provided. If you can provide some comparative
SPECmarks or some empirical comparisons, knock yourself
out.

This whole melee got started when some Mac Cheerleader
couldn't countenance the possibility of an 060 TT clone
outrunning powermacs on certain graphics intensive
operations.

Perhaps the PowerMacs are just sucking cpu cycles into some
tiny onboard Black Hole and the T60's feats are less a
tribute to it than testimony against Macs.

The Mac/PC crowd doing less with more... nah... '-p

The PowerPC 601 was derived from IBM's POWER Architecture, used in its
RS/6000 series. Motorola, Apple, and IBM all worked on the PowerPC.

I have no naieve attachment to Apple. If someone manufactures a better computer, I'll buy it. I just believe that, for my needs and wants, Apple makes the best machine for me. (I'm not here to deride anyone for the machine they use, nor do I wish to convert anyone. If you want to use an Atari, fine.)

> #include disclaimer.h

Pete is the group? Talk about how minds work!
For Peter to be an acceptable part of this group
he would have to change his format more that just
slighty.

1. Before making any negitive statement or comment
concerning Atari products, available software or
third party hardware or clones he needs to have
first hand experience with the item he is discussing
(or flaming). I think this limits his experience to
a 1040ST, probably with TOS 1.02 if memory serves me
correctly. He has no understanding of current applications,
Falcon specific hardware or software, or available clones.
Any statement he makes concerning the above hardware is
strictly his own imagination at work. It can not even
be considered hear-say or opinion.

2. Most all that get involved in his (crap) posting have
experience on both Macs and PC platforms. I can personally
say that any of his statements concerning the Apple
platform are available to all just by reading MacWorld
or the like. I find nothing he post to be of a ground breaking
nature, but then I am employed where there are over 8,000 Apple
units in use, so Apple products are nothing new to me. I
find very little exciting about their products, and have
"first hand" experience on the plus and minus of most of

their product line.

3. He needs to stop being such a whine baby shit head.
This shows in his quoting of a whole post just to
add his meanless two or three word response.

Mike

I have been reading this group for a few days. I hoped that we could all debate in here without resorting to such tactics as ad hominem attacks, and creative snipping. Unfortunately, it seems that I assumed incorrectly.

It appears that every time I address one of your points, you delete my reponse from your reply. Why is it so difficult for you to admit that I've answered your questions and responded to your requests for more information? You quote answers you don't like and give snappy comebacks, and delete entirely answers that meet your challenges. I would think that you would have the intellectual honesty to admit when you are incorrect.

Never mind; you can go back to bashing Peter Sinclair-Day, and to believing whathever you want to believe about OpenDoc, the Motorola 68060, and QuickTime, no matter how true or untrue it is. I will not respond directly to postings on this group any more. (If you want, we could continue the debate in e-mail, but unfortunately you don't like signing your posts with any e-mail address. Perhaps that should have told me something.)

So which is it? Is it free, or is it $350 per year? Keep in mind that many
Atari users haven't spent $350 for their whole computer system, so that much
per year is a HUGE investment.

This definitely puts a new twist on all the *.advocacy threads
bemoaning how much the MacOS bogs down the PPC. This could definitely
explain the data previously posted. Although this aspect is nothing
new. The Macs have been whipping boys for motorola cpu's all the
way back to 1984...

Most of Myst looks like a cross between DungeonMaster and Spectrum512.
In fact, given enough storage, most of Myst should be doable on an
ST in this fashion. It is a rather poor example actually...

To the end user, open doc and cyberdog is free. I recieved mine from the
enclosed Mac Addict CD.. However, if you are a open doc developer a membership
for professional support and tools is going to cost $....

That explains Atari's demise. There developers were too CHEAP!

You don't need multitasking apps if the system is pre-emptive.
EVERYTHING becomes multitasking. This isn't that co-operative shite.

>
>> 2. The system takes up less than three megs on Atari computers
>
>So? I have 49 megs ram and still paid under $1000....Much cheaper to boot!

Still extra cost no matter how cheap.
>
>> 4. There are numerous cheap alternatives for software
>
>Same here...My system came with over $500 in free apps.

I think they mean PD software, there is more freeware on the Atari and
Shareware tends to be much cheaper than the PC (not sure about mac
shareware prices).

>> 5. One does not have to allocate memory for every app
>
>So...

Well you don't have to allocate it, it saves time and lets the Apps
use what they need as they need it.

>> 6. Most everything is faster on the Atari computer
>Whats most everything? Try running Marathon on the ST...

I have no idea what that is but the power:performance ratio for the
atari machines is much better than for the Mac even if the total speed
isn't.

>> 7. Small applications
>We have those too! We also have big bloaty ones as well..

An app on an Atari doing exactly the same as a Mac app is likely to be
quite a bit smaller. Atari apps need to be more compact and efficient
so people try, rather than know that people will get a faster
processor if they want more speed. This means that a high power Atari
machine flies along and is a luxury rather than a necessity.

>> 8. The Atari operating system is more intuitive
>I beg to differ.. So were is publish/subscribe, opendoc, cyberdog, quickdraw
>3d and so on?

That has little to do with intuitivity. I have no idea which is more
intuitive, it will vary from person to person.

>> 9. Separate programs replace resource grabbing extensions
>Huh...Just turn mine off when not needed... No fuss, nor muss..

Nah didn't even understand the original point to be honest.

>> 10. The Atari crashes much less frequently

Yes and what fine editing you do with my sigs, you only leave them in
about 9 out of 10 times when replying to my postings.

If you have made a good point that the person has no response to then
why should they keep it int he post, it just wasted bandwith. If it's
ut then the discussion is over on that point, you 'win'. As far as
people just cutting out good questions goes I completely agree.

>Never mind; you can go back to bashing Peter Sinclair-Day, and to believing

It's been good having you here to be honest, someone with decent
arguments has made a very refreshing change and set us straight on a
few things.

You didn't seem to have read my posting correctly. How many posts
have been made in this group that are completely unconnected to Pete
ie followups to his cack? (Off topic stuff about Ethernets not
included). I would estimate about 2 in the last month. The situation
has changed a tad recently with the other bloke (Dave?) making some
good points but he says he's off again so it's just back to Pete.

The evolution from the POWER chipset goes like this:

1989, IBM introduced the POWER chipset in the RS/6000 ("RS" = "RISC System") workstation. POWER stands for "Performance Optimisation With Enhanced RISC", whereas RISC stands for "Reduced Instruction Set Computer" (but I guess we're all familiar with that by now)

In 1991 IBM and Apple joined together to produce a range of computers based around a single-chip version of the POWER chipset. (THe POWER chipset was [if memory serves] seven discrete chips.

Apple insisted that Motorola join in, as Motorola was Apples primary CPU provider.

Between them, they defined the PPC (PowerPC) architecture.

The first chip was to be known as the PPC 601. It was essentially a POWER chip with most of the PowerPC instruction set.

Some of the POWER instructions were known to slow the whole chip down, and were left off the 601 chip.

Future implementaions were to be a 602 (what it was inteded for I don't recall at this point in time), a low power consumption 603 for portable computers, and a 604 as the first full-PPC implememtation (the remaining POWER instructions do not exist on 604s).

(For further info, read the FAQ in comp.sys.powerpc)

Having power and utilizing it well are two completely different problems.
If an alpha or mac or PC cannot be made to fully realized their potential,
then the existence of that potential is really quite meaningless. Before
numbers get crunched, they have to make it to the cpu first. It seems with
Mac/PC, numbers have difficulty getting there [cpu].

The <tangent> comments were replies to me 'calling out' Peter.
That someone else was able to 'rescue' Peter really does nothing
to address the original taunting. Furthermore, the original issue
was Photoline vs. Photoshop. I had no interest in the other 2 apps
(whatever they were) and had no interest in wasting bandwidth
repeatedly copying that response again and further distributing them
across the planet.

Peter still doesn't know what he's talking about.

: >something like the Falcon as far as raw number crunching goes but when
: >you actually start running full on apps, the difference is far less
: >marked.

: A lot of applications that people frequently use are number cruchers.

All computer software, in a way, is a number cruncher, because that's really a lot of what the CPU is doing (moving around numbers). But there's a difference between a number cruncher in the general sense and a _real_ number cruncher, i.e., one whose entire purpose is moving around numbers.

For example, most of the benchmarks out there are _real_ number crunchers. Say you have a simple floating point test. You could write something like (this is in C):

[...]

```
for (x = 0; x < 10000l; x = x + 0.01)
{
for (y = 0; y < 10000l; y = y + 0.01)
{
x + y;
x - y;
x * y;
x / y;
}
}
```

[...]

This assumes that x and y are floating point numbers and that all you're testing is raw computational power. What this loop does is really simple; so simple, in fact, that on any reasonable computer it will load itself into the cache and sit there. The time taken during the benchmark will be roughly equivalent to the time taken to crunch the numbers.

A simple benchmark like that is far different from, say, being connected to the Internet while running HTTP and FTP servers, INN, a mud, and having a few dozen users doing their own thing. The latter is far

more than simple number crunching. This is again different from a PC user running Quake. Again, it's more than simple number crunching, and while simple number crunching may be what the PPC series is good at, it's not a real world test of the PPC's abilities.

: >
: > The rest of the planet calls this an application actually.

: OK, you can call it an application if you want, but in this case the OpenDoc
: people are trying to draw the distinction between monolithic do-everything-in
: one-program applications and OpenDoc parts, which are tiny self-contained
: modules that do only one specific task.

As are normal applications. Baroque, elephantine monstrosities such as
Net$cape and M$ Internet Explorer are not real `applications', but
actually `wastes of time' (I don't think very much of either).

If you want self contained applications, get separate programs.

: If you don't like using parts of
: Cyberdog, you can replace them with parts you don't like; you don't have to
: use all or nothing.

As you can with normal programs.

: > Furthermore, if it's not some monolithic thing then why is it being
: > referenced as such? Unix has had internet functionality broken into
: > many small self contained parts for years. That is nothing new.

: Cyberdog was being referenced as a suite, which is what it is. It is a
: collection of OpenDoc parts which are collectively given the name "Cyberdog."

So which OpenDoc parts fall under this suite? Do all parts fall under
the giant umbrella of `Cyberdog'? Or do only the included parts
constitute `Cyberdog'? If the former, `Cyberdog' is simply a new name
for OpenDoc along with a fancy front end. If the latter, `Cyberdog' is
really just the included suite of parts, and should be considered solely
on the basis of those included parts, not on any additional extensions.

: The difference between small applications and OpenDoc parts is that the
: parts can all be embedded in each other, the parts all share the same
: interface. The parts are designed to work seamlessly with each other,
: and this is not necessarily the case with "small" applications.

If an application doesn't have an interface that's fairly easy to
learn, then it's most likely not worth using. There are exceptions to
this, and I'll admit that a more difficult interface can be worthwhile
(for example, emacs). But that difficult interface is often there for a
reason; you couldn't effectively create a menu based sed or awk.

The unified interface concept is simply an appeal to the
point-and-drool masses who most likely don't even need a computer.

: >>OpenDoc-compatible software can work with OLE-compatible software. OpenDoc

: >
: > WHY is it better? Why should I care about either? If I have the RAM
: > I would rather just run my spreadsheet and not try to use my word
: > processor (like Windows Write) as a demented form of spreadsheet.

: If you use OLE or OpenDoc, you don't have to worry about losing information
: (formatting information, for example, like when you copy from a spreadsheet
: to a word processor and lose formatting information).

If you're losing formatting information, that shows that the word
processor and spreadsheet are not interfacing with each other properly, not
that you need an extra layer between you and the real work. The layer is
a possible solution, but a much better one, IMHO, is to include an option
in the spreadsheet to save or copy the spreadsheet as text and include
the formatting in there (easy using a printf).

Actually, on the Macintosh at least, it is far easier to get a process
onto the CPU then to get it off the CPU. Once a Mac program gets
control (and it has controlit when it is loaded) then it can use the
processor as it sees fit until it voluntarily reliquishes it.

Could you please give me a ftp address? Does this package really give
me OpenDoc functionality for unix?

A lot of people use their Macs for image processing. Image processing tends
to be CPU intensive and does not rely heavily on either IO or the operating
system.

Amazing that such a marginal machine would have superior
software available for it? Although, if this is the case,
this is as much an issue for the machines in question than
anything else.

I was arguing that it is consistent with the previous comments
wrt photoline and it is consistent with the usual performance
gains from one member of the 68K family to the next and the spec
sheet for the 68060 supports the notion that it performs like a
200Mhz 040. Also, if the Mhz spec is only the external clock and
not the internal clock (as on Pentia) then that would also be

consistent with the 68K family history as well. If the 060 is internally clock quadrupled (as someone else suggested, without the usual intel hype) that might help explain the inconsistent Photoline results.

System overhead is highly relevant. If the system is taking up too many cpu cycles playing with itself, then your processes wont get enough cpu time and that beast under the hood wont do you a bit of good.

>
>: The Mac/PC crowd doing less with more... nah... '-p
>
> What would happen, you think, if we were to put an 060 in a Mac?
> Cheers...

It would still be underutilized. You didn't comprehend the point. An Atari or Ameoba could have systems with 1/10 or 1/100 the raw power and still get more done if that meagre power it does have is more properly utilized.

Develop your 'wares as if you will never run out of computing resources and you always will run out...

If your number-crunching process is awake then this is fine.
Otherwise, not much number-crunching is going to be going on.

When you start the number-cruching operating then that process
must be "awake". I don't like the word "awake" though because
it is usually used to indicate that a process is not suspended.
The MacOS never suspends processes.

It's a desktop applications suite that makes exclusive use
of object imbedding. There's just a generic editor for all the
included objects... text, dtp, spreadsheet, graphics...

It out OLE's OLE by quite a bit but, like much freeware the
interface leaves much to be desired.

If a process is asleep then it is not currently available for execution
(for reasons other than IO blocking). The MacOS always considers a process
available for execution.

Hi there!

Here are my ten reasons to use Atari (Falcon in particular) over Mac...

1. The Atari GUI is MUCH quicker to navigate around...

2. The Atari doesn't chew as much memory just to run the OS...

3. Mac serial ports on 680x0 machines are limited to 57600 baud...

4. Mac software is more difficult to get to grips with than Atari software...

5. Macs don't pre-emptively multitask (neither do Atari's unless one has MagiC but Atari users have that option...)

6. Mac software seems relatively expensive in comparison to Atari software of a similar nature...

7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru Mac serial port, uses 33600/38400 instead of the 31250 that IS the MIDI standard...that causes timing glitches I have noticed...)

8. Macs don't have Llamazap!

9. Most files I steal from a mac have to be 'flattened' before another platform can use them (flattening separates resource and data forks that are part of ALL mac files...)

10.The single button mouse on Mac does become limited after a while, especially as more and more Atari software uses both buttons now...

There are more reasons but I get bored reminding myself of them all. I think I'll hit the PC next time so be prepared for a 100k post! :)

What the hell does that actually mean?

>3. Mac serial ports on 680x0 machines are limited to 57600 baud...
Nice try. Come back when you know what you're talking about.
I run my Performa 475 at 115K2.

>4. Mac software is more difficult to get to grips with than Atari software...
eg? How do you get to grips with Atari Photoshop, for example? Oh,
you can't, sorry.

>5. Macs don't pre-emptively multitask (neither do Atari's unless one has
> MagiC but Atari users have that option...)
What difference does pre-emptive multitasking actually make to you?
I don't see any practical difference.

>7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru
> Mac serial port, uses 33600/38400 instead of the 31250 that IS the MIDI
> standard...that causes timing glitches I have noticed...)
I can't really comment on Mac MIDI, as mine doesn't have a MIDI interface.
But no MIDI interface runs at 38400, as it's not MIDI then; the other
end would not understand it. Also worth pointing out that the Atari's
MIDI implementation is fucked, both hardware (wired incorrectly) and
software (keyboard/mouse handling can cause an overrun).

>9. Most files I steal from a mac have to be 'flattened' before another
> platform can use them (flattening separates resource and data forks
> that are part of ALL mac files...)
Oh, I see. Having a more advanced file system is a disadvantage?
Anyway, I just moved a load of pics from Mac to PC; no problem, it just
copies the data part and that contains the image.

>10.The single button mouse on Mac does become limited after a while,
> especially as more and more Atari software uses both buttons now...
Agreed, I bought a multi-button mouse for my Mac.

>/|\ ATARI Falcon030 16Mb/340Mb/32Mhz/DSP/FPU
Blimey! A 32MHz 030. Wow! And how fast does it run in 16-bit colour,
and at what screen resolution?

I can't believe I fell for this infantile flame bait...

: >
: > "..certain graphics intensive operations". That kind of narrows
: > it down, doesn't it?
: > What do you mean by "graphics.. operations" actually?

: Someone mentioned overlapping functionality with photoshop.

Hardly relevant in our system vs system comparison, as I'm
sure you comprehend.

: > Sure my 060 running SS is a bit faster in a few situations in
: > relevance to a slow PPC 601.
: > I belive this is a software-thingy though.

: Amazing that such a marginal machine would have superior
: software available for it? Although, if this is the case,
: this is as much an issue for the machines in question than
: anything else.

I'm not sure I follow you, elaborate. :)

: >
: >: Perhaps the PowerMacs are just sucking cpu cycles into some
: >: tiny onboard Black Hole and the T60's feats are less a
: >: tribute to it than testimony against Macs.
: >
: > You were arguing that the 060 is twice as efficient as the PPC.
: > This argument is flawed - system overhead is highly irrelevant.

: I was arguing that it is consistent with the previous comments
: wrt photoline

Which are fundamentally wrong.

: and it is consistent with the usual performance
: gains from one member of the 68K family to the next and the spec
: sheet for the 68060 supports the notion that it performs like a
: 200Mhz 040.

I can assure you that there are NO serious benchmark showing
this, not even silly ones I'm prepared to bet on.
For most integer opperands the 50Mhz 060 performes like a
50-60MHz 040, although the FPU is on heavy steroids.
For memory-intensive tasks or software taking advantage of its
superscalar features it's about 3-4 times faster than a 25Mhz 040.

: Also, if the Mhz spec is only the external clock and
: not the internal clock (as on Pentia) then that would also be
: consistent with the 68K family history as well. If the 060 is
: internally clock quadrupled (as someone else suggested,

Wrong I assure you.

: without
: the usual intel hype) that might help explain the inconsistent
: Photoline results.

The bclk (bus-clock) is doubled to form the pclk (processor-clock),
in much the same way as the P5s.

: System overhead is highly relevant. If the system is taking up
: too many cpu cycles playing with itself, then your processes wont
: get enough cpu time and that beast under the hood wont do you a bit
: of good.

It is not relevant in our comparison in which you started off
by stating that the 060 was twice as fast as the PPC601.

: >: The Mac/PC crowd doing less with more... nah... '-p
: >
: > What would happen, you think, if we were to put an 060 in a Mac?
: > Cheers...

: It would still be underutilized. You didn't comprehend the point.
: An Atari or Ameoba could have systems with 1/10 or 1/100 the
: raw power and still get more done if that meagre power it does
: have is more properly utilized.

Of course you're right, but this is a different matter.

: Develop your 'wares as if you will never run out of computing
: resources and you always will run out...

Sure.
Cheers...

It means that, with no direct compairson of functionality,
The GEM desktop looks, feels and smells faster than the Mac OS.
Everyone that uses a TOS based machine with NVDI will tell you
this. A good compairson is to have MagiC Mac loaded on your
Performa. You will instantly notice that the MagiC enviroment
responds quicker than the Mac OS does.
>
> >3. Mac serial ports on 680x0 machines are limited to 57600 baud...

Why would an Atari user want to use Photoshop when they have a much
better
option? I think what he means is that most Atari software has a much
simpler user interface that accomplishes much the samething as the
slower, more user friendly (ha, ha, ha, ha) Mac OS.

That is the point. You don't see the difference because it's in the
background:). Try formatting a floppy disk on your Mac, and while it's
going about it's thing, try to launch Photoshop. I think you will get
the point.

The dark ages of an OS, yes.. The Atari OS will never change..

> 3. Mac serial ports on 680x0 machines are limited to 57600 baud...

You sure?

> 4. Mac software is more difficult to get to grips with than Atari software...

Please explain?

> 5. Macs don't pre-emptively multitask (neither do Atari's unless one has
> MagiC but Atari users have that option...)

Mac users have the option to develop on the web, while Atari users do not have that utility. Macs can be internet servers while the ST can't.. Macs are going places while ST's will go to landfills..

> 6. Mac software seems relatively expensive in comparison to Atari
> software of a similar nature...

Prove it?

Thats funny, I am not aware of any Games multitasking. At least the Amiga did in some form..

>>So? I have 49 megs ram and still paid under $1000....Much cheaper to boot!
>
> Still extra cost no matter how cheap.

True, not cost prohibitive. To do any serious work on the Falcon required 14 megs. Atari did sell a 14 meg version. I use many low memory apps. I still use a Microphone version dating back to 1992..

Now, that I am starting web development(a pipe dream on the ST), the ram will come in handy..

>>Same here...My system came with over $500 in free apps.
>
> I think they mean PD software, there is more freeware on the Atari and

Are you inhaling funny stuff? Prove it that the power/performance ratio is better. Apple has just released the $1500 PowerMac 6360, a 160 mhz of the 6300 line which includes 16 megs ram, 1.2 gig, keyboard, 28K modem and tons of software...Also, the equivelant UMAX C500 is $1299!

>>> 7. Small applications

>What difference does pre-emptive multitasking actually make to you?
>I don't see any practical difference.

You have control over the applications rather than them taking control
of your machine. If I have a raytrace running, I tell it exactly how
much of the processor time it can have and if I have a bit spare
anyway then it gets given it. I've switched pre-emptive multitasking
off to see what it was like and although usable it wan't nice.

I've never had the problems that you mentioned, it's not AFAIK wired
incorrectly but simply utilises un-used pins on the Out port, if you
use cheap cables with pins wired together then yeah you might get
problems. So what if you think keyboard/mouse handling may cause an
overun, Macs don't even have any MIDI ports to overrun!

Michael Grove <mgrove@ridgecrest.ca.us> writes:
>It means that, with no direct compairson of functionality,
>The GEM desktop looks, feels and smells faster than the Mac OS.
There's the rub. We are fully aware of the trade-off between functionality and performance; the ST has little functionality so can be faster. The GUI doesn't even give you popup menus, listboxes, etc. Everyone has to roll their own (popups are in TOS 4/MagiC, but most users don't have these) and most seem to do them slightly differently.

>Everyone that uses a TOS based machine with NVDI will tell you
Remember that I have owned a number of Ataris, including a Falcon. It's a bit sad that the OS was so cack that hacks like NVDI were necessary, even after several TOS releases it was so slow...

>Why would an Atari user want to use Photoshop when they have a much
>better option?
Like what? Photoshop was just one example, but there's no equivalent Atari app available as far as I can see (certainly not in the UK). We have laughably bad things such as DA's Picture.

>Try formatting a floppy disk on your Mac, and while it's
>going about it's thing, try to launch Photoshop.
I was just waiting for someone to come up with the "formatting a floppy" line. That's the only one anyone ever seems to come up with, and as I format a floppy about once a month, it's not really a big deal, is it? Anyway, there's no reason why the formatter can't be co-operative.

>Ok, take a UUE encoded file from a PC disk and load it into teach text,
>of simple text. Save it and then try to decode it. Does it work?
Dunno, I just drop PC uue files onto a decoder (uucd) and a pic comes out. Seems simple enough. And I have uucd configured to give the file the correct type such that a double click then brings up the pic in GraphicConverter. It would be even nicer if GC understood uuencoded files, I could do it in one step then.

> Photoline results.

The 68040 is not clock doubled.
The 68060 is neither clock quadrupled nor clock doubled.
(At least not in the way that instructions are executed with a faster clock speed than the external one. Both CPUs use the external clock speed to execute instructions.)
Check out the comp.sys.m68k FAQ for details.

Using the internal clock in marketing is no hype if instructions are actually executed using that clock speed, as is the case with x86-CPUs.

In every day use ways...we have a Mac at work,...I've used it on and
off over the last few years...in no way, shape, form or function is
it easier or even as easy to use as my Falcon...Maybe this is a
totally subjective thing, and I don't have a million dollar research
group looking it over, but its my opinion and I will not change it,
no matter how much wind blows or Mr. Sinclap inhales... :)

>> Hmm...do you think he might have actually meant 68000 Macs?

They are not irrelevant, if that was what he meant...

>> Its faster, more effecient, just plain better...
>There you go again, nothing concrete (except "faster"; but pre-emptiveness
>does not in itself make anything faster at all).

Wrong...pre-emptive multitasking systems are recognized the world over
(except in Mac circles-grin!) as being superior to co-operative systems.
Try formatting a disk, and at the same time opening Photoshop...<heh>

>> Funny how an awful lot of very professional, and powerful software
>> got written for it anyways, isn't it? :)
>But all pro s/w now is for PC and Mac...

Wrong, wrong, wrong...Cubase Audio, Calamus SL, Papyrus, Apex Media (and
soon Apex Audio) etc, etc, etc,...(tired of typing) :)

>> AND how fast does you DSP chip run on your Performa? <heh>
>Doesn't need one, I put a PPC in it!

Then you don't know what you are missing, do you??? <smile>

>> Still extra cost no matter how cheap.
>
>True, not cost prohibitive. To do any serious work on the Falcon required 14
>megs. Atari did sell a 14 meg version. I use many low memory apps. I still
>use a Microphone version dating back to 1992..

It depends what you mean to be productive, you could easily write a
novel or something on an old 286 or ST or Amiga or Mac or PC
whatever you don't need lots of space for productivity like that
although 4 meg+ is obviously recomended.

>Now, that I am starting web development(a pipe dream on the ST), the ram will

>Prove that the ST shareware is cheaper? Compare equivelant shareware..

From the PC stuff that I've seen in magazines, some people seem to
have the idea that $50 is ok for a shite disk util, I did take a quick
look through some MAc mags that I had and yes software was actually
very cheap for the Mac but I never commented on Mac prices before.

>> Well you don't have to allocate it, it saves time and lets the Apps

>better.

It's far more trouble than it is worth to be honest just to prove a
point, how do you want me to measure chip power? What tests do you
want me to do? Whatever I try you'll only give me the usual compare
Photoshop shite, someone stated some tests before but you responded
with "your mac must be broken" or similar. And BTW I do know what
Marathon is, I just wasn't thinking about games at the time.

>Apple has just released the $1500 PowerMac 6360, a 160 mhz of the 6300
>line which includes 16 megs ram, 1.2 gig, keyboard, 28K modem and tons of

Mostly with less (mostly useless) features but rarely reduced
functionality. My WP for example (That's Write 3) does far more than I
need it to do exen with all the TOC/Index generation, instant
correction, macros, scripts etc it's only about 1 meg in size.

It's great that even a low end ST opens windows in an instant without
tonnes of processing power even with a hack like NVDI, I don't know if
you have used NVDI recently but now it's more than just a OS speeder.

>>Try formatting a floppy disk on your Mac, and while it's

NVDI is no hack. That just indicates how very little you
understand the way that GEM is put together. The system was
really quite modular. It doesn't matter whether or not the
system is using Atari's graphical api or someone elses. Just
point the appropriate trap vector to where you've loaded the
new VDI and go. Extensibility in this respect is strictly
through design.

Code to the api spec and each of GEM's 5 layers could be
provided by entirely separate & distinct groups.

Okay, per a conversation that was going on earlier, I went back and researched the DEC Alpha vs Falcon demo controversy. It was at CeBit '93, and I found the text describing what happened in Z-Net # 496, volume 8, issue 12, posted April 12/13, 1993. I found this particular issue on the Crawly Crypt CD-ROM volume 1, under magazine/znet/ZNET9312.ASC...

I'm sure this event is mentioned in other places as well, but this is the one I found...

Bill Rehbock of Atari is the person doing the talking here...

DEC (Digital Equipment Corp.) established that a reliable benchmark of the overall performance of a computer was how fast it could calculate and display a 256 color Mandelbrot set. The Mandelbrot set is the most popular example of a class of mathematics know as Fractals. When the data is plotted, beatiful pictures are generated on the computers screen. DEC showed that a Mac Quadra took 12 seconds to create the display, a 486DX-66 took 8 seconds, and the 150 mhz DEC Alpha took 4 seconds...On our (Atari's) video wall, 60 feet away from DEC's demonstation, we showed the same demo being done by a low cost home computer in only --4-- seconds AND in 16-bit color...much to the irritation of DEC...

Of course, we are talking about the Atari Falcon 030 here...!

No, that's correct. It makes the system more persistent against program
crashes, for instance.

>Doesn't need one, I put a PPC in it!

You cannot replace a DSP with a PPC or vice versa. They're designed for
completely different tasks.

Any cleanly written TOS or GEm program runs perfectly under pre-emptive
multitasking - you may try the MagiCMac demo version to check.

With pre-emptive multitasking, a dialog box does not hinder your entire machine from rendering some graphics during the night (as it does on the Mac). With pre-emptive multitasking, playing a digitized piece of sound will not lock your entire machine (as it does on the Mac). With pre-emptive multitasking, ...

Just because you don't have a clue about the advantages doesn't mean there aren't any.

>Having a more advanced file system is a disadvantage?

In which way is the MacFS "more advanced"? Give me a Be or Unix FS instead, for the MacFS really sucks - copying files lasts about as long as on a TT - just install Copy Doubler on the Mac and don't use Kobold on the TT.

Maybe less, but more than enough. And as you state yourself, more
responsive. Teach me something. I converted a .moov to over 500
jpg files. I wanted a DOS file extension, but didn't check what the
Debablizer default extension was for a jpg file. It turned out to be
.jpeg. Not usable on a DOS file system. Now how, from the Mac O/S,
can I rename all of the extension to .jpg without additional
software?

> The GUI doesn't even give you popup menus, listboxes, etc.

Neither does the Mac unless you hold down the mouse key. With MagiC
(I consider this an O/S upgrade just like your Mac O/S upgrades)
you just hold the mouse over an Icon and presto, pop up files and
menus.

>Everyone
> has to roll their own (popups are in TOS 4/MagiC, but most users don't
> have these) and most seem to do them slightly differently.

I can't image not having a Falcon. So your statement means little to
me. Just like someone who use to have a Mac plus and now has moved on.
The users that have stuck with ST's and Mega's have made the decision
that those machines perform the task required of them and the
results and performance meet their expectations. I would also
think in todays world that they have also been exposed to
Mac's and PC's so made their decision from experience.

>
> >Everyone that uses a TOS based machine with NVDI will tell you

I don't remember anything about what you owned. Have any good
Falcon hardware for sale?

> It's a bit sad that the OS was so cack that hacks like NVDI were
> necessary, even after several TOS releases it was so slow...

Nothing sad about an O/S under developement. TOS 4.04 is pretty
increditable to come from such a small company as Atari was
and performs well under the aged processors that those machines
use.
If it was without merrit, you wouldn't see Mint or MagiC or
Geneva or..... NVDI a hack? I hardly thing so. If you have
owned a TOS machine you know better:)

What about Mac O/S 7.5/7.5.2/7.5.3/7.5.5 ? Just because Mac
updates their own O/S makes it better? I find the third party
O/S software quite refreshing. It gives myself and other users
the option to customize their system to their liking, or budget.
>

> have laughably bad things such as DA's Picture.

What kind of machine are you talking about running Photoshop on?
Again, an Indigo 3 will make ANY Mac look puke green. So if your
wanting to compair a Mega or even a Falcon to an 8500 there must
be some consideration to the performance ratio of the hardware and
software under question. I haven't used DA's Picture. I can't compair
it to Photoshop. I have used Photoline under MagiC Mac and on a
Falcon and can say the I much perfer Photoline to Photoshop on either
Machine, Mac or Atari. I'm sure I would also be please with the
performance
of the application on a Hades 060. Debablizer is a nice conversion
application on the Mac, but even on a 40mhz 040 Mac it is equaled in
speed by Image Copy. Granted it has more funtions, but those don't
cause the speed difference. I think having to drag around all the
extra weight is what slows it down. MagiC dosen't seem to have this
problem on the Mac. But then, you get what you get with the Mac O/S.
All or nothing. It's nice to have kind of a modular system when using
TOS or MagiC.

>
> >Try formatting a floppy disk on your Mac, and while it's

> Anyway, there's no reason why the formatter can't be co-operative.

Ok, writing to a floppy:). Same thing, and bottle neck. Background
DMA transfers are nice under MagiC. Actually I find the Mac O/S
quite usable, if abit slow. When I want to print a mail label or
check my Mail however, I go for the Falcon first. I can be done in
almost the time it takes for the Mac to get warmed up. The Mac
does have much more advanced hardware available for it. I can capture
video direct to harddisk, convert the movie to targa files and drop

it on my Atari formatted harddisk under MagiC, plug in the Falcon and
have a ball with Apex. No Preimer, Quick Flix or Avid, just Apex.

Anyway, as cack as TOS or MagiC are, the Falcon can still hold it's own.
More and more applications are available, so it seems that I won't be
tossing it into a "landfill" anytime soon. My Quadra on the other hand
will find a new owner once a Hades 060 takes it place.

Have you crashed Netscape today?

What would be the purpose? He would fine that the same operating system
that was on the 68000 Mac is on the PowerMac, and that the Falcon has
changed dramaticaly over the Mega. He would discover that TOS is even
more user friendly that it was on the Mega and offers a bundle of new
features. He would still find the Mac confusing and slow, reguardless
of which Mac he tried.
I fail to see where this would benifit you arguement.

Yeah right. Using "forbid()" means multitasking, then? Any commercial game
on the Amiga uses "forbid()" to _prevent_ multitasking.

Some Atari games that multitask: columns, ballerburg 2.1, gemory, gemtrek,
shanghai, kubis96a, nanjing, sokoban, wintris, yukon.

>Prove that the ST shareware is cheaper? Compare equivelant shareware..

Calamus SL is "small" and has "less features"? Tell the guys who publish
the Calamus DTP magazine "invers". They'll laugh in your face.

And "Papyrus 4.5" has just been published in an OS/2 version and got a
great review by "c't".

E.g. an Atari TT (32 MHz 030) is faster in GUI operations than a 9500 Quadra. If the GUI is faster, one can work faster.

And the Mac file selector is worse than even that of TOS 1.0. Seems the German language "Inofficial Mac FAQ" should be translated to break Macaholics' blindness.

When have you seen an professionally installed Atari system last time? The AES is very well capable of such things, it's just that the desktop itself (which is an application, not a GUI) lacks certain features. Use Thing or Ease instead and/or install a small program taht does the task (Mac users consider this perfectly legitimate on the Mac, but Atari users are not allowed to do this, right?).

On the Atari, you can eject a disk without dragging it's icon to the
trashcan icon (which is _very_ intuitive on the Mac, anyone would throw
something into the trashcan to remove it from the drive). On the Atari,
ejected media are not requested back in certain situations.

>> Its faster, more effecient, just plain better...
>There you go again, nothing concrete (except "faster"; but pre-emptiveness

It _is_ faster, check MagiCMac to get an idea on how fast it is. This has
nothing to do with pre-emptive multitasking (that just adds responsiveness
to the system and prevents stupid locks by badly written programs).

: > the usual intel hype) that might help explain the inconsistent
: > Photoline results.

: The 68040 is not clock doubled.
: The 68060 is neither clock quadrupled nor clock doubled.
: (At least not in the way that instructions are executed with a faster clock
: speed than the external one. Both CPUs use the external clock speed to execute
: instructions.)
: Check out the comp.sys.m68k FAQ for details.

: Using the internal clock in marketing is no hype if instructions are actually
: executed using that clock speed, as is the case with x86-CPUs.

The MC68060 Broduct Brief from Motorola tells me that:
"The timing of the bus is fully configurable to match external
memory requirements".
That implies two timers, one for the bus and one for
the processor.
Hence, it seems to be able to do clock-doubling like the Intels.
Cheers...

The Color Classic was presented ca. 1993 and has a 030 processor (32
MHz?). Otherwise it would be unable to run System 7.

This Color Classic was a 68030/32 mhz on a 16 bit bus, Yea Apple crippled it..
Was this Mac running under 16 bit color/32,000 colors and word? Was your Mega
running under 32,000 colors with high res and the equivelant apps. If so get
back to me....

No, the 040 doesn't. This has been talked about and harped over time
and time again, and if I still had my old Mac I could give you a quote
from Apple's designers saying this wasn't the case. If you care
enough to do so, post to an Apple technical newsgroup; you should get
a reply from someone in the group givin the correct information.

I'm a bit suprised at you, actually. This is a pretty old topic...

>
> Did you try using a Mac?

I quote the above statement from Denis above "I used a Mac a couple of
times".
Not only do you know nothing whatsoever about computers except what you
read
in the monthly rags, you can't read.

>
> > First of all it took me some time to start with the Mac. I realised that

>
> Easier to use?

Ya, that is what he said. For him it was easier to use.

>
> > This Mac is a Classic color (68000 CPU, tell me if I'm wrong). It was

> running under 32,000 colors with high res and the equivelant apps. If so get
> back to me....

Ya, I think he is running with a Panther Graphics card installed. It's
only about $150.00. Blows away Mac video modes through the Quadra
040 line for a lot less money.

>
> > When I inserted a PC disk the Mac told me something like "not a Mac

>

> I guess you did not have the included Apple PC translator utility which would
> of detected the disk..

Ya, it's kind of confusing. Especially when you upgrade an older version
of
the Mac O/S and don't have all extensions or control pannels loaded on
hard disk.
The install just replaces what you have currently active. I wonder how
many
Mac users are running a crippled system because they don't understand
this.
Let's see, jump over to the Mac newsgroup, jeez, I can't believe the
types of people a mainstream computer platform brings onto the internet.
Some of those questions are pretty ignorant.
I think I see a good place for you to visit 'Plop. Your presence there
should give you the ego boost you need.

> >
>
> True...But Apple is not in trouble...

Apple will be history soon enough. What do you think, maybe 5 or 10 more
years? At least then the defunct Apple hardware will be available for a
reasonable cost. To bad all the Motorola programmers will be retired and
the up and comings will be working on Intel platforms.
I hope Doug Little is still happy then with his current hobby and
platform :)

From: chriswil@southern.co.nz
Message-ID: <550opc$6j@orm.southern.co.nz>
Source record: 8121

I knew this would get you guys going!

PETER SINCLAIR-DAY (sinclap2954@cobra.uni.edu) wrote:
: In article <54km6h$57j@orm.southern.co.nz>, chriswil writes:
: > Hi there!
: >
: > Here are my ten reasons to use Atari (Falcon in particular) over Mac...
: >
: > 1. The Atari GUI is MUCH quicker to navigate around...
:
: Navigate what?

Yes Navigate! If I want to go to a deeply nested directory it it MUCH
quicker to do so using my Falcon as I always seem to be waiting for MacOS
to finish its frilly bits before I can d-click on the next directory...

: > 2. The Atari doesn't chew as much memory just to run the OS...
:
: The dark ages of an OS, yes.. The Atari OS will never change..

Until each new release of MagiC, MiNT, XaAES, oAESes, Geneva, Thing etc...
comes out...

: > 3. Mac serial ports on 680x0 machines are limited to 57600 baud...
:
: You sure?

Yes. _Most_ 68k Macs are limited in this way. Some newer 68k Macs can do
better (ie. newer Performas, AV macs of course)...

: > 4. Mac software is more difficult to get to grips with than Atari software
:
: Please explain?

Does this need explaining? The learning curve on software is MUCH steeper
on _most_ Mac software I have seen compared to comparable Atari software
with similar features...

: > 5. Macs don't pre-emptively multitask (neither do Atari's unless one has
: > MagiC but Atari users have that option...)
:
: Mac users have the option to develop on the web, while Atari users do not have
: that utility. Macs can be internet servers while the ST can't.. Macs are
: going places while ST's will go to landfills..

He's getting toey now! How do you mean 'develop' on the web? I happily
develop offline and online web pages for my Atari club, and with each new

version of CAB etc...I can do more of what PC/Mac users might take for
granted with the WWW. Admittedly the Atari is behind in things like Java
etc...but this is only because the w**kers who invented these things
'need' one to sign corporate-propellor-head-mentality-bureaucratic-bumph
licensing agreements, and that, despite what Sun says, will cost big $$$

: > 6. Mac software seems relatively expensive in comparison to Atari
: > software of a similar nature...
:
: Prove it?

APEX media for 100UK Pounds. Gimme a Mac app that even comes close for
similar $ and I'll tear my head off and feed it to myself. Other examples
exist like Photoline, DA`s software, Steinberg software, and much more.
All these apps provide as much if not more features than similarly priced
versions for the Mac...

: > 7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru
: > Mac serial port, uses 33600/38400 instead of the 31250 that IS the MIDI
: > standard...that causes timing glitches I have noticed...)
:
: More Macs are in use for that utility..

Really? That surprises me, for as a semi-pro bass-player over the
years I would have said that the jerky timimg resolution I hear on Mac
MIDI setups would be unacceptable to most studio worth their name...

: > 8. Macs don't have Llamazap!
:
: ST's don't have PPC!

But they do have 68060, and according to Computer DirecT they may have
PPC before too long...checkout Computer DirecT's homepage
<http://www.compdirect.com/> to see what they are up to...

: > 9. Most files I steal from a mac have to be 'flattened' before another
: > platform can use them (flattening separates resource and data forks
: > that are part of ALL mac files...)
:
: Interesting concept..

Yes. A right pain, especially if I'm grabbing large QT movies. The problem
exists mainly with software that lives on CD-ROM for the Mac, as such
software is written to the CD in a dual-forked format that incorporates
the resource and data forks for the file in one chunk...

: > 10.The single button mouse on Mac does become limited after a while,
: > especially as more and more Atari software uses both buttons now...
:
: Two buttons are here as well..

Yes, but you have to go out and get a two-button mouse first...

: > There are more reasons but I get bored reminding myself of them all. I
: > think I'll hit the PC next time so be prepared for a 100k post! :)

I'm not kidding (much!) :)

I would still like to know if Mr. Sinclair-Day has actually used a Falcon
before, and how it was setup...maybe someone should show him one day and
make him eat all those words from over all those years...

> ANYBODY can develop on the web...with any decent ASCII editor...its not
> the software, its the individual...(which you'll never understand)

Yes, but we do it better with apps like HomePage and PageMill. No need to use an ASCII editor, when one just has to plop in text, graphics, photos, video and sound with ease. Now get back to me when you can hook up a digital camera to the ST.

> Pick up any Mac Warehouse mag, and read the prices for software, then

The problem is, there is no equal in the ST world. ClarisWorks caan be had for $69 and Word Perfect $99.

>>> 7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru

Yes, I call over 30 significant items a change! Did you -bother- to
read that post Mr. Sinclair or are you doing a knee-jerk reaction because
I was able to post such a listing??? :)

>> Like dragging the floppy icon to the trash can to eject the disk! Ooooh,
>> anybody would have guessed that one its so intuitive! :)
>
>Thats difficult? Just you..

I -DARE- you to put any 10 novice users in front of a Mac and ask them to
figure out -on their own!- how to get a floppy disk out!!!! Then you come
back here and tell me its just me having difficulties!

>Yes, but we do it better with apps like HomePage and PageMill. No need to use
>an ASCII editor, when one just has to plop in text, graphics, photos, video and

Agreed that there aren't any Web page apps -yet- for the Atari...I've sure
someone will though, and I know it will offer most of the features, with
more ease of use, and at a lower cost than comparable programs on other
platforms...(as is the case with most Atari software!) :)

Ditto for the digital camera...

>> Pick up any Mac Warehouse mag, and read the prices for software, then

Time and time again powerful, efficient Atari programs have been listed
that match up well feature-for-feature against apps on -any- platform,
and yet you still act like you haven't seen them...Your ability to read

and comprehend English is becoming very suspect, Mr. Sinclair...do you
happen to have a green card, by any chance? :)

Hmm...the PC? <heh>

>>>ST's don't have PPC!
>>

>
>PPC processors have rendered DSP obsolete..

I doubt that...even the PC world has figured out that the brute
strength cpu approach doesn't work...thats why now they are off-
loading things to video accelerators, etc,...something that has
been known in Amiga/Atari camps for years... :)

>> Like you can take any file and instantly transfer it to any other

AND because it hasn't happened to you, it hasn't happened to any Mac
user, eh? Get real...you obviously have never used a Mac/PC transfer.

A request for a 2-button mouse has never been made by an Atari user!

I have trouble with that remark about the Falcon...I'm using mine
in 256 color mode, without NVDI, and its plenty responsive enough.

Immediately got out and what? Not quite...thanks to the surprizingly
vibrant Atari public domain scene, almost anything you could want is
available free, or for a very modest fee...just look around! :)

Back when I used to be an Amiga Advocate, I tried this argument and got
torn to shreds.

Just like I do with POV on the co-op mt Mac, then? Pre-emptive multi-tasking
makes very little difference to the user. It does make life easier for
the programmer, though. I would definitely prefer that the MacOS was
pre-emptive, I'm just trying to say that it's not the end of the world
that it is not.

>I've never had the problems that you mentioned, it's not AFAIK wired
>incorrectly but simply utilises un-used pins on the Out port
^^
Precisely. This is in contravention of the MIDI standard, so is
incorrectly wired.

>So what if you think keyboard/mouse handling may cause an overun,
It's fact.
Again (like pre-emptive vs co-operative), it's not a show-stopper; but
programmers of serious MIDI apps have to work around it.

>you have used NVDI recently but now it's more than just a OS speeder.
I know, I still use it as a font rendering engine. But it's main role
for many people is to replace the cacky slow graphics routines that Atari
couldn't be arsed to fix even in TOS 4. Have you tried scrolling a window
on a 256-colour Falcon screen without NVDI? The fact is that when you
buy something like a Falcon, you immediately have to go out and get a load
of other things (eg NVDI) to make it work properly. I know, I had one.

By the way Mr. Sinclair, or is it Mr. Day?

The version of Photoslop we use is v3, soon to updated, err upbloated to v4.

The version of PhotoLine we used to compare it to does not have all of the features of Photoslop, and Photoslop does not have all of the features of PhotoLine. They are about as close as you can get though. The major difference is that Photoslop has support for layers whereas PhotoLine does not (yet). PhotoLine however handles image scaling better, has better masking tools, has many plug in filters (free), doesn't require expensive accelerator cards to make it useable (err functional) and sells for less.

There are some things that PhotoLine does better than Photoslop and vice versa. This is inherent in software packages even packages on the same platform exhibit these differences...Illustrator vs. Freehand as one example. Live Picture vs. PhotoSlop.

PhotoLine executes, loads and filters faster.

PhotoLine run on the same Mac9500 outperforms PhotoSlop by an impressive margin, this of course under OS emulation called MagiCMac which brings true 32 bit preemptive multitasking to the Mac. Something you won't have until the next millenium if Apple still exists by then.

For me to suggest that the 68060 is architecturally better or even remotely close to the architecture of a PPC would be ludicrous and you took this out of context. The point is that a 68060 running a compact and efficient OS and highly optimized applications is able to outperform a PPC running the bloated garbage coming out for it.

And we sell Macs...

The comparison was between TOS running TOS applications on a 68060 and MacOS running MacOS applications on a Mac 9500. The time to do a specific task on both machines is what we are comparing here. The DirecT60 will blow the doors off a Mac, or any other desktop for that matter, on pretty much any test we can throw at it.

If there was not so much wasted resources, so much bloat and so much disk intensive access going on, this 9500 should outperform a 68060. No doubt about that. But, it doesn't because the macOS is slow, hell my friends Volkswagen is faster than the MacOS.

I asked you to do some benchmarks on a 20MB TIFF and whatever app you wanted to use and haven't heard back from you. Having a hard time

finding a 20MB TIFF and an app that can come close to the speed I posted? Whenever you are ready...

For fuck's sake, can no-one come up with a better example than
formatting a floppy? Maybe I'm unusual, but I format about one per month.
As I said elsewhere, there's no reason why a disk formatter can't be
co-operative anyway. The Atari and Mac ones are not, but it would be
trivial for Atari or Apple to fix that. Neither seem likely to :-(

> Then you don't know what you are missing, do you??? <smile>
I did have a Falcon, remember!

Michael Grove <mgrove@ridgecrest.ca.us> writes:
>from the Mac O/S, can I rename all of the extension to .jpg without
>additional software?
You can't (apart from the long-winded manual approach, of course). But I
don't see how you can do this with MagiC either. It's trivial with a Unix
shell, of course. If your complaint is that the Mac let you use .jpeg
as a file extension, then I don't understand your problem; you seem to
be saying that a limitation in the DOS file system is a problem with MacOS.

>Neither does the Mac unless you hold down the mouse key. With MagiC
>(I consider this an O/S upgrade just like your Mac O/S upgrades)
>you just hold the mouse over an Icon and presto, pop up files and
>menus.
I was talking from a programmer's point of view. The MacOS contains functions
for putting up and handling these things. TOS does not. MagiC does, but
then most apps assume that they may be running under plain TOS, so the
programmers end up rolling their own menu etc routines. As I said, they
don't all do them the same.

>Have any good Falcon hardware for sale?
No, I sold it a year ago. The person I sold it to has shifted it on
to someone else already. I have a 1040STF going cheap though!

>the option to customize their system to their liking, or budget.
I'd agree with this, I use a few third party add-ons to improve MacOS,
including PopupFolder, which adds functionality that's built-in to Ease.
There you go, one point to Atari!

>Debablizer is a nice conversion application on the Mac, but even on a
>40mhz 040 Mac it is equaled in speed by Image Copy.
Dunno about DeBabeliser, I don't have it. I do know that GraphicConverter
decodes and displays faster than ImageCopy, even when running on exactly
the same machine.

>Have you crashed Netscape today?
:-)
Don't use it any more, it requires too much memory due to poor implementation.
Internet Explorer is much more frugal for the same (ish) functionality.
I don't like using IE on principal, but Netscape is just not sensible
any more.

That's not really a function of the multi-tasking nature of the OS.
The STe etc can do this because digitised sound is done via DMA; it can
do this with plain TOS, which is clearly not pre-emptively multitasking.
I will not comment on the sound architecture of the Mac as I do not know
enough about that subject.

We kicked you out 220 years ago over such stupidity.

This is a public forum; my identity is not required.
If you cannot address my ideas and then feel the need
to attack things which are distinctly not my ideas then
you show far more cowardice than do I.

The GEM VDI can be replaced quite easily without the need for
'hacking'. Merely replace the appropriate trap vector with a
pointer to whereever you have loaded the new trap handler. That
trap handler should be little more than another jump table with
entries for each function (bios,xbios,gemdos,vdi,aes). Then just
follow C call frame conventions for whatever language you happen
to be using.

Admittedly, however, the writters of NVDI could have gone out of
their way to make their lives complicated.

NVDI should no more be a 'hack' than an alternate winsock.dll for
windows should be.

Believe me, there is no clock-doubling far and wide in Motorola
processors. Yes, the external hardware has to supply two different
clock frequencies to the processor chip, read closely: they are
fed to the chip from the outside, so no internal clock-doubling
at all. I don't know the actual names of these signals by heart,
but let me put it this way: There is the "main" frequency which
determines the speed of internal computing, and then there's a
second frequency, doubly as high as the main one, which signal
only serves for synchronization purposes. So normally you publish
and use that lower, "main" frequency. Apple wants to achieve some
marketing effect and uses the higher, meaningless frequency. Yes,
it's there, but it's not the real thing, and it's no internal
clock-doubling.

From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <96303.232231STIRRE31@MAINE.MAINE.EDU>
Source record: 7999

I will admit that graphics on the Atari Falcon were a little
slow. With NVDI they were acceptable. NVDI is well worth
the price. It is not like the Falcon is unusable without
it either. I used mine for over a year with no imrpovements
and was very happy with it. For word processing I would
switch to monochrome.
As far as software I would like to know an alternative to
Pagestream on the Atari for the Macintosh in the same
price range. I doubt there is one. I have found that
finding old versions of software for the Macintosh
is difficult. Sources for used software on the Atari
seem to be everywhere. I personally like Atari Works
as well and it may lack many features that Claris Works has but it
is easier to use, is very fast, and solid.
Photoshop is probably more powerful than similar programs on
the Atari. However, there are many choices on the Atari side,
they are cheaper, and they are probably much faster.
Having used Atari software for a few years and swithced to
a Macintosh I am not impressed with the offerings except
for those for the Internet. Even here Atari software is improving
and there is now an alternative to CAB.
I made a comment in my first post about the Atari allowing
a user more control. Some examples are assigning programs
to a key to launch, choosing a preference location
for individual programs, setting file masks, moving and renaming
files, and being able to eject a floppy.
Just some additional thoughts.
-scott tirrell

>Try scrolling, eg, the file list in the file selector in 256colour mode.
>See that slow scrolling, that odd rainbow effect?

Like most Atarians, I switched over to a different file selector long ago...I use Selectric (and am thinking about trying Freedom-have you seen it? Looks simply smashing) and it scrolls AT speed...and I've always run in 256 color mode... :)

>> vibrant Atari public domain scene
>Although I no longer look, when I last did (about a year ago) there
>was quite a lot of free stuff and shareware (but very little public
>domain; be careful with this term). But most of it was crap. And
>since when was NVDI free?

Since when did I ever say that NVDI was free? Shareware, Freeware, Postcard ware, Chocolate ware (yea Dan Wilga!), public domain, or whatever you wan to call it--has produced some of the finest soft-ware on Atari computers. I salute these programmers extraordinaire!

>You call that change?

It's not the same as before as it has differences. That sounds quite a
bit like change to me.

>> Like dragging the floppy icon to the trash can to eject the disk! Ooooh,
>> anybody would have guessed that one its so intuitive! :)
>
>Thats difficult? Just you..

Difficult and intuitive are very different, that isn't intuitive.

>>>Mac users have the option to develop on the web, while Atari users do not have
>>>that utility. Macs can be internet servers while the ST can't.. Macs are
>>>going places while ST's will go to landfills..
>>
>> ANYBODY can develop on the web...with any decent ASCII editor...its not
>> the software, its the individual...(which you'll never understand)
>
>Yes, but we do it better with apps like HomePage and PageMill. No need to use
>an ASCII editor, when one just has to plop in text, graphics, photos, video and
>sound with ease. Now get back to me when you can hook up a digital camera to
>the ST.

That wasn't the original point, we most certainly do have the option
to develop web pages. I use a macro system to develop my web pages and
it's just as good as most software for at least the majority of
functions, all web software really does it insets a few text strings
into documents either by ising the mouse which slows everythign down
or by using keyboard shortcuts so I just use macros, it's quite
simple, if you have these far superior WP's then why don't you make
the most of them before getting more software? I personally (and I
would assume most people) have no way to justify the cost of a digital
camera, if I want a few pictures on my machine I'll just get them
plopped onto a Photo_CD and load 'em up, quite a bit cheaper than even
a cheap digital camera and the quality is much better too.

>> Pick up any Mac Warehouse mag, and read the prices for software, then
>> find its equal in Atari commercial/shareware software, and you quickly
>> understand! (tis not hard to do either...)
>
>The problem is, there is no equal in the ST world. ClarisWorks caan be had for
>$69 and Word Perfect $99.

Again it's the old feature debate, I decide to buy a program depending
upon the usefulness of it's features rather than the number of them.

>>>> 7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru
>
>>>More Macs are in use for that utility..
>>
>> As well as doorstops and paperweights, but that doesn't make them
>> superior at either function!
>
>Just like the ST, only Atari.

Again you make that stupid statement, the person just said that Macs
are in use as doorstops, you agreed and said that STs were too and in
the same sentence say "only Atari", nice logic, both are doorstops but
only the ST is a dorrstop, hmmmm.

>Open an issue of Keyboard magazine and see what
>platform is reviewed the most..

Open Atari Compuing and see what machine is reviewed most.

>>>ST's don't have PPC!
>>
>> AND Macs don't have Apex Media, DSP chips as standard, etc, etc,...
>
>PPC processors have rendered DSP obsolete..

Pity they don't render as well as one...

>>>> 10.The single button mouse on Mac does become limited after a while,
>>>> especially as more and more Atari software uses both buttons now...
>>>Two buttons are here as well..
>> Is that as standard or do you have to request it? :)
>Request it like you have to request options on the ST..
Never had to request two buttons for my ST mouse, I don't remember
having to request a keyboard either or pay extra for it...

This part below is called a signature, using your "superior" software
(which I assume supports cut and paste) you cut these from the
original posting when replying to postings, it's quite easy if you
have an intuitive system.

Actually guys, the best reason to use an Atari versus a Mac is
whether you like the philosophy behind which the computer was designed.
Every computer that has ever been designed has retained the
"personality"
of the first incarnation of that platform. And of course, later models
of the platforms merely added to that quality. I don't much like PC
compatibles because they were originally boring, stiff, business
machines. And now we have the new PC's, which act like the same old
(albeit faster and improved) PC, wearing a new set of clothes. I think
I'm right with this, aren't I?

:
: Ya, I seen this and knew he was in trouble with this statement.

Not for earlier 68k macs. The LC3 I have tried to use was unable to talk at over 57600 despite Z-term allowing the user to choose 230400 baud. On asking mac retailers why >57600 wasn't working, they replied that earlier 68k macs were not up to such speeds...

So my comments are really those of people who sell macs...

Were you one of the ones that slated the Mac selector?!
Anyway, I only used the selector as an easy way to see something scrolling.

>has produced some of the finest software on Atari computers.
That's not saying much, is it?! The main free s/w I used was stuff
ported from other platforms (GNU stuff, POV etc).

How about giving us some examples? You surely aren't going
to try to tell me that GemView is up to the quality of GraphicConverter?

Nope, I've never discussed the Mac selector...

I still have doubts about that statement. I'm using a standard Falcon
with 4 megs/810 meg hard drive at 640 x 480 with 256 colors and no
NVDI and I don't see any problem with scrolling anywhere...

>>has produced some of the finest software on Atari computers.
>That's not saying much, is it?! The main free s/w I used was stuff
>ported from other platforms (GNU stuff, POV etc).

Its saying a whole lot...You've obviously not been very exposed to
the sharware/freeware scene...you should look around it a bit before
slagging it...

>How about giving us some examples? You surely aren't going
>to try to tell me that GemView is up to the quality of GraphicConverter?

I can't and won't comment on GraphicConverter because I've never used
it...GemView is an outstanding program though. Along with CAB/STik,
Oasis, Freedom, the Apex Media viewers, ST Zip, POV (as you mentioned),
CD-Player, Edith, and hundreds of others...(these just come to mind
right off the top of my head)

Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy

Dr. Peter Kittel writes:

: Believe me, there is no clock-doubling far and wide in Motorola
: processors. Yes, the external hardware has to supply two different
: clock frequencies to the processor chip, read closely: they are
: fed to the chip from the outside, so no internal clock-doubling
: at all. I don't know the actual names of these signals by heart,
: but let me put it this way: There is the "main" frequency which
: determines the speed of internal computing, and then there's a
: second frequency, doubly as high as the main one, which signal
: only serves for synchronization purposes. So normally you publish
: and use that lower, "main" frequency. Apple wants to achieve some
: marketing effect and uses the higher, meaningless frequency. Yes,
: it's there, but it's not the real thing, and it's no internal
: clock-doubling.

This is all and well but essentially what you describe
is old news, we sorted _this_ rumour out years ago.
The 040s FPU _does_ however run clockdoubled, albeit with
the same dutycycle as the bus-clock.
Cheers...

>So what is this $50 PC title?

I can no longer find the mag with this title as PC mags are out of
date as soon as they are printed so I tend to bin them after reading
them. However a recent issue of PC Format has a password protection
utility for your machine at 31 UKP, an ESP tester at $35, a screen
grabber for 20 UKP admitedly not quite as bad value as this disk util
but hardly good value for money. I can't imagine the ST versions of
any of those getting above 10 UKP and more likely around 5.

>He was using a low feature and functionality app compared to a high featured
>one. I made a point that ClarisWorks loads up faster than MS Office...

Let's be honest here, you assume it to be a low feature app, I doubt
that it is quite as feature packed as Photoshop but I feel that you
are underestimating it's abilities.

Depends on how you look at it. The C-Lab machines are designed for audio recording and as such are competitive in that market and do=
rather well. These machines can record 8 tracks of audio simultaneously from either 8 analogue or digital sources.

How much for a Mac that can do that?

The RAM upgrade is overpriced, we sell them for 200.00 Cdn.

Subject: BIG news!

BIG news!
By Donald A. Thomas, Jr.

The election is coming up. That seems to be important. It's big news each night on radio and television lately. When I think hard about it, I am not sure why. Many people feel, as do I, that politicians say what they have to in order to be elected. Who knows what they'll really do in office. Even if I gloss over that admittedly defeatist viewpoint, there remains another popular viewpoint that the election is already decided... at least this year anyway.

I suppose it's tradition. We all have to talk about it and hear about it just because it's America's ultimate soap opera. After all, obvious slam dunk elections have turned up as big misses at the polls in the past. It could happen again. As for me, I'd just love to see an innovative game company develop a program that pitched famous politicians against each other. Since the early days, when Activision released their blocky "Boxing" game in 1980, one-against-one bouts have been a popular video game subject. I'd love to see Clinton and Dole go at it in a video game. Perot makes a great on-deck challenger too! I suppose they'd have to V-Chip the game and gray out any blood scenes. I should run for President. I'd love to be in that game to throw some punches. Hey, everyone, write me in! <g>

"Turning Point", a popular television news magazine, featured an in-depth life-after-death segment the other night. Do you suppose there's a coincidence that Halloween is around the corner? Nah, they wouldn't be that corny, would they? The only explanation is that it must be big news. Personally, the entire concept seems to me to be more philosophical than newsworthy. If it wasn't for my family tying up the television, I would have preferred to play "Crypts of Chaos" (20th Century Fox, 1982), "Demon Attack" (Imagic, 1982), "Entombed" (USgames, 1982), "Frankenstein's Monster" (Data Age, 1983), "Ghostbusters" (Activision, 1984), "Ghost Manor" (Xonox, 1983) or "Haunted House" (Atari, 1981). Although none of those equal the notoriety earned by the likes of "Asteroids" (Atari, 1981) or "Missile Command" (Atari, 1980), they were all fun, share a spooky theme and helped wear the metal contacts thin on my Atari 2600 cartridge port.

So the world is changing. No one cares if our President ever inhaled and schools turn in six year olds for kissing classmates to show affection. (Just imagine the outcry if "Custer's Revenge" (Mystique, 1982) was released in today's climate.) Sports games are hot news to gamers, but the mainstream

press never mentions them. There's not enough room in the newspaper after you cover the more important non-sports news, you know what I mean, don't you?, the strikes, the spitting, the car crashes while boozed up. I think there's more real game action at Little League. For me, a good game of "Real Sports Baseball" (Atari, 1982) or "Bowling" (Atari, 1978) gives me all the virtual sports action I ever needed and the players never wind up being arrested.

Yes, the world is changing. "PacMan" peaked when he made the cover of "Time Magazine" in the October 25, 1982 issue.

They don't still sell Ralston's "Donkey Kong" cereal (1982) any more, right? I don't know. I stopped helping to pick cereal when I stopped seeing those cool video game promotions on the backs of packages each month. Yea, I see them sometimes now for a complete PlayStation system or a Big Screen TV, but it's not the same. They used to give away trips to Atari Headquarters and full size arcade games. I still have a couple dozen of the scratch off cards handed out at McDonald's restaurants in 1982 based on popular video games. Why don't they do things like that anymore?

It was April 1976, when Atari first released the coin-op version of "Breakout". I remember sharing time with a friend at a convenience store well past midnight on one of those machines. Through the cigarette-stained glass and our own smoke filled eyes, we would stare at colored "bricks" and bouncing pixels for hours on end, driving the four-cornered ball past the front rows of bricks and into a wild frenzy against the back rows through a corridor at one side of the screen or another.

Back then, things were different. No one heard of Aids and teenagers were afraid of being caught at something rather than catching something.

I wish I kept the old newspaper clippings I saved back then. I one day threw them away because it was clear to me then that video games and home computers were front-page topics forever. I never had enough room to store all that paper. There were great video game magazines then just as there are now too. Back then, though, even "Playboy" and "Popular Science" talked about the new form of adult toys that integrated sizzling visuals, tantalizing sounds and responsive joysticks into one heck of a good time. Do they still cover those topics anymore?

So who is buying these great new video games in stores today? Do none of these people watch television or read newspapers? Why is it that the video game industry is so huge, but new product releases and great top-notch programmers hardly ever rate in the entertainment sections? Where is Warren Robinett lately? Who's he dating? Is he married? Children? Why isn't he ever in the celebrity round-up section of USA Today? (Please don't tell me you don't know who he is. You'll really make me sob.)

By the way, one of the institutional founders of the gaming industry proverbially died a few weeks ago. JTS, a disk drive company, absorbed all of Atari Corporation's assets and pretty much soaked it all up with few traces of the monolith that once stood. Ever see the witch melt in Wizard of

Oz? Kind of the same thing, except muted.

No big deal though. After all, Atari's final fall is not nearly as big news as predetermined elections, kissing babies, spitting athletes and Halloween stories of an afterlife. Is it?

Subject: Did you say "Goodbye"?

Did you hear anyone say "Goodbye"?
==========
by Donald A. Thomas, Jr. (10/4/96)

It's odd to imagine an institution, which was as big and as powerful as Atari once was, to have been shut down in recent days. The real amazement for me is that it was all accomplished without a measurable flinch from within or outside the gaming industry. I can understand that gamers wanted to push Pong out the door early in the timeline. I can appreciate that the classics such as Missile Command and Asteroids do not push 32-bit and 64-bit systems to any technological limits. I know all these things intellectually, but the heart cannot face the truth that the world and the corporate machine known as Atari could not find an amicable way to coexist.

On Tuesday, July 30, 1996, Atari Corporation took each and every share of it's company (ATC), wrapped them all in a tight bundle and presented them to JTS Corporation; a maker and distributor of hard disk drives. On Wednesday, the shares were traded under the symbol of JTS. Within a few weeks, the remaining staff of Atari that were not dismissed or did not resign, moved to JTS' headquarters in San Jose, California. The three people were assigned to different areas of the building and all that really remains of the Atari namesake is a Santa Clara warehouse full of unsold Jaguar and Lynx products.

It was only as long ago as mid '95 that Atari executives and staff believed things were finally taking a better turn. Wal*Mart had agreed to place Jaguar game systems in 400 of their Superstores across the country. Largely based on this promise of new hope and the opportunities that open when such deals are made, Atari invested heavily in the product and mechanisms required to serve the Wal*Mart chain. But the philosophical beliefs of the Atari decision makers that great products never need advertising or promotions, put the Wal*Mart deal straight into a tailspin. With money tied up in the product on shelves as well as the costs to distribute them to get there, not much was left to saturate any marketplace with advertising. While parents rushed into stores to get their kids Saturns or PlayStations, the few that picked up the Jaguar were chastised by disappointed children on Christmas day.

In an effort to salvage the pending Wal*Mart situation, desperate attempts to run infomercials across the country were activated. The programs were professionally produced by experts in the infomercial industry and designed

to permit Atari to run slightly different offers in different markets. In spite of the relatively low cost of running infomercials, the cost to produce them and support them is very high. The results were disappointing. Of the few thousand people who actually placed orders, many of them returned their purchases after the Holidays. The kids wanted what they saw on TV during the day! They wanted what their friends had! They wanted what the magazines were raving about!

In early 1996, Wal*Mart began returning all remaining inventory of Jaguar products. After reversing an "advertising allowance" Atari was obligated to accept, the net benefit Atari realized was an overflowing warehouse of inventory in semi-crushed boxes and with firmly affixed price and security tags. Unable to find a retailer willing to help distribute the numbers required to stay afloat, Atari virtually discontinued operations and traded any remaining cash to JTS in exchange for a graceful way to exit the industry's back door.

Now that JTS has "absorbed" Atari, it really doesn't know what to do with the bulk of machines Atari hoped to sell. It's difficult to liquidate them. Even at liquidation prices, consumers expect a minimal level of support which JTS has no means to offer. The hundreds of calls they receive from consumers that track them down each week are answered to the best ability of one person. Inquiries with regard to licensing Atari classic favorites for other applications such as handheld games are handled by Mr. John Skruch who was with Atari for over 13 years.

In spite of Nintendo's claim that their newest game system is the first 64-bit game system on the market, Atari Corporation actually introduced the first 64-bit system just before Christmas in 1993. Since Atari couldn't afford to launch the system nationwide, the system was introduced in the New York and San Francisco markets first. Beating the 32-bit systems to the punch (Saturn/PlayStation), Atari enjoyed moderate success with the Jaguar system and managed to lure shallow promises from third-party companies to support the system. Unfortunately, programmers grossly underestimated the time required to develop 64-bit games. The jump from 8-bit and 16-bit was wider than anticipated. In addition, Atari was already spread thin monetarily, but were required to finance almost every title that was in development.

After the initial launch, it took Atari almost a year before an assortment of games began to hit store shelves. Even then, having missed the '94 Holiday Season, many of the planned titles were de-accelerated to minimize problems caused by rushing things too fast. Consumers were not happy and retailers were equally dismayed. The few ads that Atari was able to place in magazines were often stating incorrect release dates because that information changed almost every day although magazines deadline their issues up to 120 days in advance.

It was in 1983 that Warner Communications handed Jack Tramiel the reins of Atari. By this time, Atari was often categorized as a household name, but few households wanted to spend much money on new software and the systems were lasting forever. No one needed to buy new ones. That, combined with

Warner's obscene spending, amounted to a *daily loss* of over $2 million. Atari was physically spread all over the Silicon Valley with personnel and equipment in literally 80 separate buildings; not considering international offices and manufacturing facilities. Mr. Tramiel took only the home consumer branch of Atari and forced Warner to deal with the arcade division separately. Within a few years, Jack took the company public, introduced an innovative new line of affordable 16-bit computers and released the 7800 video game system.

To accomplish these miracles for Atari, Jack implemented his "business is war" policies. While people who publicly quoted his statement often felt that policy meant being extremely aggressive in the marketplace, the meaning actually had closer ties to Tramiel's experience as a concentration camp survivor. Of the 80 buildings in Sunnyvale, Santa Clara and Milpitas, almost every one of them were amputated from Atari's body of liabilities. The people, the work, the heritage, the history were fired or liquidated. Those who survived were unsympathetically required to fill in the gaps and while most tried, few actually found a way to be successfully do what a dozen people before them did. Atop the mountain, Jack pressed with an iron thumb. All Fed/Ex mailings were required to be pre-approved by one of a handful of people. "Unsigned" purchase orders went unpaid regardless of the urgencies that inspired their creation. Employees found themselves spending valuable time trying to find ways around the system to accomplish their jobs. Many of them lost their jobs for bending the rules or never finding a way to make things work. As horrible as it all sounds, it actually was the only way to protect Atari as a company and give it a chance to survive, as it did and did very well.

Jack's introduction of the 16-bit computer was initially hearty in the United States but it went extremely well in Europe. Europeans were not accustomed to "affordable" technology and although the Atari computers were not IBM compatible, it didn't matter because people could afford them. Jacks' private laugh was that the computers were sold at prices much higher in Europe than Americans were willing to pay. As a result, most of the machines made were being shipped to European destinations to capture the higher margin. This enraged the people in the United States that had been Atari loyalists. While waiting months for stores to take delivery domestically, international magazines were touting ample supplies. Those in the know within the U.S. became dismayed. The remainder never knew Atari was slowly abandoning the value of Atari's name recognition as it became easier and easier to forget, some assuming Atari had long filed for bankruptcy.

On a technical level, Atari 16-bit computers were designed beyond their time. For less than $1,000, consumers could enjoy "multimedia" before the phrase was ever really widely used. The icon-based working environment proceeded Windows popularity although the essential attributes of the two environments were very similar. MIDI was built-in and became an instant hit in the high-end music industry. Tasks were activated and manipulated with a mouse and the system accepted industry standard peripherals such as printers, modems and diskettes.

With all the genius that went into the technology of the machines, very little of equivalent genius went into the promoting and marketing the machines. Mr. Tramiel was the founder of Commodore Business Machines. When he introduced the PET computer in 1977, Jack discovered he didn't have to call a single publication. Instead they all flocked to his door demanding an opportunity to see the product. News magazines. Science Journals. Business newsletters. Newspaper reporters. They were all there with microphone, camera and pen in hand. And they kept coming back. Adding a switch, announcing a new 4K application or signing a new retailer were all big stories the press wanted to handle.

Today, a new video game announcement may generate a request from any of the dozens of gaming magazines for a press release, but a lot of costly work has to be done to assure fair or better coverage. Editorial people are literally swamped with technical news. Samples are mailed regularly to their attention. Faxes fly in through the phone lines and e-mail jams up their hard drives. It takes a lot to grab their attention.

While Atari retained hopes to be successful with the Jaguar, Atari's marketing people were fighting established standards in the industry with severe handicaps. Since cartridges (the Jaguar was/is primarily a cartridge-based system) were so expensive, editorial people were required to return them before new ones would be sent. Editorial people like to assign review projects. So finding cartridges they sent out was not always easy to do. Additionally, reviewers often love their work because they get to keep what they write about. Regardless, the few magazines willing to cover Atari products were more often turned away because of a lack of programmable cartridges or any number of other indecisive barriers. In-store signs and posters were sometimes created, but many retail chains charge premiums to manufacturers that want to display them. Some direct mail campaigns were implemented, but Atari often could not afford to keep those things being advertised on schedule. Therefore, the advertisements were published and distributed, but the product was not available.

Clearly, Jack's experience with the world beating a path to the door of a company making a better mousetrap no longer applied. The world had revolved a few times beneath him and he never noticed. The tactics used to successfully sell Commodore computers were simply antiquated notions from the past. Meanwhile, Sony launches the PlayStation with over $500 million in marketing funds. Today, the PlayStation is considered the most successful next-generation gaming machine throughout the world. Sony bought the market. Tramiel's Atari never learned how to do that. Actually, they never could afford it anyway.

After the 1990's got underway, Europe as well as the rest of the world, discovered that IBM-compatible computers were becoming more powerful and more affordable. The world always did want computers at home just like in the office and companies like Dell and Gateway exemplified the industry's trend toward home-based office computers. As a result, companies like Commodore, Atari and Next couldn't compete any longer. While the dedicated user base of each of them felt abandoned by these companies having to leave the computer market, the inevitable prevailed. Commodore jumped ship, Next

changed business goals completely and Atari invested what they had left in the Jaguar game system. Even today, Apple is kicking and screaming. As good as Apple was at creating a huge niche for themselves, they focused more heavily on education. When kids grow up and get jobs, they want business machines. IBM was always the business standard.

When one examines the history of Atari, an appreciation can grow for how many businesses and people were a part of the game over the years. Chuck E. Cheese Pizza was started by Atari's founder, Mr. Nolan Bushnell. Apple Computer was born in a garage by ex-Atari employees. Activision was founded by Ace Atari programmers. The list goes on and on.

But for some pathetic reason Atari's final days came and went with no tribute, no fanfare and no dignified farewells. Why? Where did all the talent go? Where are all the archives? Where are the vaults? Where are the unpublished games and where are the originals of those that were? Why has no company stepped forward to adopt the remaining attributes Atari has to offer? Where are the creditors? What has happened to all the properties and sites? Where are the databases, warranty cards, promotional items, notes on meetings, unanswered mail? Who owns P.O. Box 61657? Who goes to work in Atari's old offices? Where do consumers have their systems fixed? Who is publishing new games? Who still sells Atari products? Why are there still a lot of people talking about Atari on-line?

I'm an ex-Atari employee and proud to have been. I'm still an Atari devotee and proud to be. To me, these are questions which all deserve an answer, but who will ask them?

The best people to ask these questions are those who have exposure to the public. If you believe Atari left us without saying goodbye, contact Dateline at dateline@nbc.com. If you REALLY believe, then send this article to 10 of your friends in e-mail. AND if YOU REALLY, REALLY believe, mail a few to newspapers or other news programs. A letter in your own words would be great!

I'd spend money for a thorough retrospect on Atari. Wouldn't you?

Wouldn't it at least be nice to say "Goodbye"?

Significant changes? Looks like small hacks.. If you call these major
changes, you are probably right.. These are indeed major changes for TOS..
Still years behind by the other modern OS's

> I -DARE- you to put any 10 novice users in front of a Mac and ask them to
> figure out -on their own!- how to get a floppy disk out!!!! Then you come

Already have.. At one of the local elementary schools, students do it all the
time when they need to eject the CD. The Mac platform has already graduated to
CD's while a certain one is still in floppy infancy..

> Agreed that there aren't any Web page apps -yet- for the Atari...I've sure

You think it will happen? What would be a lower price? Lower than $99. Why
does this platform always play catch up instead of leading for once?

The average comparable ST software that is cheaper is a pipe dream..

Thanks for your message Don. I, too, find it amazing that Atari could not only fall from greatness, but disappear. At one point in the early 80's, Atari was one of the top 5 recognized brands in the U.S. (#2, I think.)

Having worked with (not for) Atari for many years during their peak, I have my own rational as to what happened, and why. It's sad.

I am auctioning the following Atari Computer Equipment and Software:

Atari 130XE
Atari 130XE w/ 320k and RamRod OS
Atari 800
Atari 1200XL
Black Box Hard Drive Controller w/ 64k Print Spooler
Black Box Case
20 Meg Hard Drive
Power Supply for the Hard Drive
Atari 1050 Disk Drive w/ US Double
Atari 810 Disk Drive
Atari 810 Disk Drive (Untested)
Magnavox Amber Monitor
Atari 835 Modem (Untested)
Atari 410 Program Recorder
Koala Pad (Untested)
Microflight Joystick
Various Joysticks, controllers, Power Supplies and Cables

Approximately 390 disks full of software, most double sided

Books:
Your Atari Comes Alive
Tricky Tutorial Series
Your Atari Computer
Mapping the Atari
Electronic Computer Projects
Atari Roots
De Re Atari
Atari Technical Manuals

Visit the Auction site at: http://www.ebay.com/aw/item.cgi?item=ybi025010

They would have been major changes on any OS...and ease of use with TOS
has yet to be matched by any other OS...

>Already have.. At one of the local elementary schools, students do it all the
>time when they need to eject the CD. The Mac platform has already graduated to
>CD's while a certain one is still in floppy infancy..

You're telling me that at a local elementary school, with no prompting
from anyone else, that the kids just "KNEW" to drag the floppy disk icon
to the trash can, to eject the disk? (remember I said novices here, with
no prior Mac experience!!!) The Mac was forced to move over to CD's just
like the PC market due to ineffecient coding and software "bloat"... :)

>You think it will happen? What would be a lower price? Lower than $99. Why
>does this platform always play catch up instead of leading for once?

Because the people who code for TOS/GEM (for the love of it!) wait to
see all the mistakes that are made in a "trend" then taking advantage
of TOS's efficiency and ability to use resources without waste, write
better versions... :)

>The average comparable ST software that is cheaper is a pipe dream..

I dream with that software every day on my Falcon 030... <smile>

My requests for examples have gone unheeded, unfortunately.

For me, most of my time is spent in applications not "the OS" (I assume
you mean Finder and/or TOS desktop by this; or what else do you mean?)
For apps, one of the most important things is consistency between different
programs, so that it's easier to learn the basics of each different app.
Atari s/w, for various reasons, didn't get that level of consistency.
There's not even agreement on which keys to use for cut and paste.
Or even Open/Load!

> from anyone else, that the kids just "KNEW" to drag the floppy disk icon
> to the trash can, to eject the disk?
That's just one example, and it's a fine one. But why the obsession with
floppies? I guess they're more important to an ST user than someone with
more modern kit. When asked for examples of bad UI, that's all anyone
has come up with. When asked for examples of multi-tasking, all anyone
can talk about is formatting floppies. What's the floppy obsession?

> I dream with that software every day on my Falcon 030... <smile>

I realize that the original point was that neither early 68k Macs
or Early Atari's (before '90/91 or so) could run faster than 19200,
but I just wanted to point out how easy it is to make any Atari,
even the 520ST (circa '85) run higher serial port speeds...Thanks.

MacOS would be the LAST system to not yet have fully Pre-emptive
multi-tasking. It came to TOS quite some time ago (3+ years). MacOS
may have it... some day. Until then, apple will just keep throwing
application level toys at it's userbase and attempt to call them a
part of the OS.

>Or even Open/Load!

Hmm...most of the Atari software I use, follows very similiar conventions.
For example, [esc] clears the line/field you're in, [tab] will take you
to the next menu item...etc, etc,... I do agree that too many programmers
"did it their own way" because they thought they could do it better. You
know, sometimes they were right though...I give Douglas Little of Black
Scorpion and their outstanding, world class product, Apex Media, which
does not use GEM...but is extraordinary, nonetheless...as an example.

>That's just one example, and it's a fine one. But why the obsession with

>can talk about is formatting floppies. What's the floppy obsession?

I don't think its really a floppy obsession but its an example that
shows how well multitasking works because formatting a floppy really
ties up most systems resources...I've seen an Amiga format 2 and 3
floppies simultaneously, while other desktop activities were being
performed...not much slowdown either! MagiC and Neodesk do this as
well, on Atari's...(background)

>Which spreadsheet do you use?

I have LDW Power, a Lotus 1-2-3 compatible...but I've been looking
at Twist, a relational database program that looks pretty cool, and
as you know, a lot of times, databases and spreadsheets can do the
same functions...(have you seen Opus2.2? Looks good as well!) I have
Atariworks, and while it can't do every single little thing some of
the heavyweights in the Mac/PC world can, it does -most- and its very
solid...

Sure, whatever you say.. Hmmm..I wonder if I still have my my collection of
ANALOG and some issues od ST LOG laying around, must be boxed in the attic.
Actually I learn whats new in the weekly rags like MacWeek..

> Ya, that is what he said. For him it was easier to use.
>

Others would disagree..Such as Bruce Webster and my try with the ST. Not as
polished as the Mac.. Depends on one's perception.. However, the industry
states that the Mac is the the most inutive and easier to use.. That is
generaly a fact..

>> > This Mac is a Classic color (68000 CPU, tell me if I'm wrong). It was
>> > running system 7 and it was slow, slow, slow. Well, when I run Multitos

> 040 line for a lot less money.

The problem is that the Quadra is no longer available new, so how can you state
is cheaper? However, Performa 6116's can be had for $599, includes a CD-Rom
to boot.

> Ya, it's kind of confusing. Especially when you upgrade an older version

> types of people a mainstream computer platform brings onto the internet.

> Some of those questions are pretty ignorant.

What ignorant questions? Could it be that these new users are first time buyers/users of a given platform. As I recall, there was ignorant questions about the ST during the early years..

> I hope Doug Little is still happy then with his current hobby and
> platform :)

Why 5-10 years? Do you have a crystal ball? Apple hardware is a bargain today...Much cheaper to boot than a Falcon and the Hades..

This semester campus sales will exceed the previous fall one significantly. We have students/staff beating down the door to get a hold of the 6400's. Doing at least one demo(two every other week)has done wonders to my sales..

Directory? I use aliases..No fuss/nor muss...

> Until each new release of MagiC, MiNT, XaAES, oAESes, Geneva, Thing etc...
> comes out...

You mean hacks. As for memory usage, Mac OS and Windows do more and cost less. Considering that machines come with 16 megs, not an issue. I upgraded to 49 megs, and my setup is still cheaper than a Falcon.. Why is the Falcon over priced?

> Yes. _Most_ 68k Macs are limited in this way. Some newer 68k Macs can do
> better (ie. newer Performas, AV macs of course)...

Which exceed the numbers of the ST platform..

> : Please explain?
>
> Does this need explaining? The learning curve on software is MUCH steeper
> on _most_ Mac software I have seen compared to comparable Atari software
> with similar features...

Depends on the software.. I understand that Calmus wasn't a piece of cake to master either. However, apps like ClarisWorks have no equal on the ST platform..

> He's getting toey now! How do you mean 'develop' on the web? I happily

Exactly.. Don't expect WebStar, PageMill, Claris Homepage and many other internet apps/tools anytime soon on the ST platform. Heck, you can't even hook up a digital camera to the ST platform that Mac users take for granted.. Digital camera a tool for web development...

> : Prove it?

Right. Right next to the sentence that -ALSO- says that Photoshop does
-NOT- have all of the features of Photoline, either...Doing your best
to ignore that part, are we?

>> PhotoLine run on the same Mac9500 outperforms PhotoSlop by an impressive

Once again, you've totally missed the point...Anybody can read the above
paragraph and see that the point he is getting at is that even under an
emulator (which are notorious for slowing performance down because of the
overhead) it outperforms Photoshop...Need someone to interpret for you
since you can't/won't grasp the obvious? Nice try anyways...

>> The comparison was between TOS running TOS applications on a 68060 and

Ya, the poster was talking about older Mac's which do not infact
support serial port speeds greater than 57.6K.
Make sure you follow the rules of the Atari flamers.
When you talk about a 1986 1040ST you MUST compair it to
a 180mhz PPC! If you are talking about a Falcon, you must be
on your knees before the keyboard praying that your are not
struck dead because you are not using the same machine as
Sinplop or have Be O/S painted in rainbow colors on your
bedroom wall!
So there!

Mike

> Atari s/w, for various reasons, didn't get that level of consistency.
> There's not even agreement on which keys to use for cut and paste.
> Or even Open/Load!

With that kind of consistancy, how can you tell the difference between
you desktop and the application your running. If you have kids, will you
require them to wear uniforms to school and look just like the rest?
>
> > from anyone else, that the kids just "KNEW" to drag the floppy disk icon

> more modern kit. When asked for examples of bad UI, that's all anyone
> has come up with. When asked for examples of multi-tasking, all anyone
> can talk about is formatting floppies. What's the floppy obsession?

Ok, you want a real example utilizing a multasking system. Take a QT
movie and get the latest version of Sparkle for your Mac. Now convert
the QT movie to the MPEG format. You will find you can't do anything
else with the system while it is performing the compression.
Now search ftp for a Mac file called QT2MPEG.sit.hex. Unstuff it.
Here you will find a Mac users solution to your non-multasking Mac
O/S problems. Included inside the package, you will find a port
of Mint for the Mac and a program called "just enough TOS" that
you can install on your machine to make it Atari worthy. Included
in the package is an MPEG encoder that will run in the background
under Mint while you can still utilize your machine. Of course you
will have to understand a little Unix, but what the hell, both you
and SinPlop seem to know more about whatever in the universe is in
the making so an old O/S such as Unix shouldn't be much of a problem.
Kind of ironic. The only way to make a Mac multitask is to install
another O/S. And two of the four available are TOS compatible.
Atari's have been doing this for quite some time.
I didn't even say the word floppy once :)

That's two (big) points for Atari now.

Mike

The Atari users have the option of using Start. Much tider than Mac
aliases.

More like uses more and does less with it.
I would like to see that 49meg simm.
The Falcon i'm sure is not more expensive than your system. Prove it.
Don't quote Toads add's. They do not have the current prices on memory
listed in on their web site. A 16mb Falcon can be had for less than
$1000.00. Your memory upgrade cost at least $235.00. That means you
obtained your Mac for less than $765.00. If this is true, you surely
don't have the machine you claim to have. Did you pick up a second
hand Mac II by mistake by chance?

Ya, sure. That's why they are bearly making it in the Microsoft invasion
of
the Mac user base.

Ya, I surely want a little overpriced CCD that can put out a 160*100
7fps picture of you ugly face over the internet.
Digital camera? I thought you were talking about video. I don't see
where
connecting a primitive imaging device such as all of the under $2000.00
digital camers are to my Atari or Mac being something to shake my wang
at.
The picture quality is crap on the Mac, and if a driver was wrote for
the
TOS machines to utilize one it would look like crap there as well.
Better to purchase a nice 35mm and a Epson 1200 scanner for your Falcon
or ST. Digital photography technology is way to far away for you to
try to use that for a stick to lean on.

What is so great about a PPC? What does a CPU upgrade for your machine
cost
to take it to, say, 180mhz PPC? About two grand, right?

No, it won't be a port. I think what he is getting at is the ability to
run
PPC software on the 060 based machine, much like the $1500.00 dollar
Pentium
cards for the PPC's to run Dos or Windowz or whatever they do.
It will be interesting to see how you react to this. You support in your
post all of the new and planned Mac clones, yet i'm sure that an Atari
clone
able to run PPC will leave a very bad taste in you mouth.

Just like I said. When was the last time you developed any
useful software or hardware for you Mac. Did you find a creative
way to route your mouse cable? Did you install a spinning mouse
icon?

>
> > Ya, that is what he said. For him it was easier to use.

Bruce who? Depends which Mac your talking about.
Just because John Delorian made a bad deal dosen't
mean the car is bad. But then again, i'm sure industry would
say that. The only fact is that Apple was more sucessful than
Atari in the computer market. It does not mean that it is a better
machine for everyone. If it was, Apple would be sharing the
same building as Bill Gates, but we all know that just isn't
going to happen.

>

Get a life. The equivelant apps statement dosen't apply to the 68000
Mac. It flat out won't run the software you keep bringing up. It is as
dead as the TRS 80. Nobody wants those. Where I work I have seen
thousands in the excess heap. Even the schools won't pick them out
of the scrap pile.
I would also like for you to send some photos all these ST's are
going to.
>

> to boot.

You had better check up on your Mac facts. Sever dealers advertise
"Brand New" Quadra 950 and Quadra servers. The 950's go for $1500.00
8mb/no hd.

No one interested in computing would waste their money on a Performa
6116.
What a piece of shit. A $135.00 586-133mhz will blow it off.
Ya, were real stupid. How can you justify posting crap like this?
Talk about machines heading for the landfills, cripes, why do you
think they are selling them so cheap?

>
> > Ya, it's kind of confusing. Especially when you upgrade an older version

> Crippled system in what way? How?

Da, figure it out. You probably have never updated your O/S. You get
your
network administrator to do it for you. You know the guy that dosen't
have
time to police your illegal post to the usenet?
You know I love it when I check Deja News and see all the canceled
SinClap
messages. How did you manage to get through this time?

>

> about the ST during the early years..

If the machine is soooooo " inutive" as you like to say,
and I will actually quote you on this:
"Depends on one's perception.. However, the industry
states that the Mac is the the most inutive and easier to use.. That
is
generaly a fact".

If the machine is "sooooo inutive" why all the "help me with
opentransport"
or "help me with Mac TCP" or "help me with Free PPP" or "help me with
trying to run Adobe Premeier 4.X on my Mac plus with 4mb of ram", or in
your
case "help me view pictures in the alt.binaries.xxx group".

> today...Much cheaper to boot than a Falcon and the Hades..

A bargain compaired to what it cost just a couple of years ago. How many
people do you think gave up on their Mac II's and Quadras an moved over
to Pentiums when they were released? I haven't read anywhere figures
stating that the Mac share of the PC market has increased lately.
More PC's are probably sold in a day than Apple and the clone
manufactures
sell in a week.
A bargin in todays market is the SGI Indy line, some of which can be had
for less than 5K. The screen saver on one of these renders faster than
any application available for the PPC's. If you really want a bargin get
a DEC Alpha 433mhz rendering station for about 16K. Even if you could
outfit a Mac with same software (LightWave 3D, ect..) it would come no
where close to the performance of these machines. So you see, you

machines
performance is reletive to your pocket book, not the Apple name on it.

That wasn't the 'dare' it was to place novice users in front of the
machine and get them to work it out, not look at users who 'always' do
it and were probably told in their I.T. lessons.

>The Mac platform has already graduated to
>CD's while a certain one is still in floppy infancy..

CD's do exist for the Atari and you are infinitely stupid for
suggesting that it is still in floppy infancy.

Why monochrome? Isn't the color good enough for wp? No need for monochrome on
the Mac because the color is crystal clear.

Pagestream is comming to the Mac. According to an article and screen shots in
MacFormat from the UK..I am not sure what the current price of Pagestream is,
but PageMaker can be had for $199 from your local school bookstore.

You must have a different diffinition for ease of use and solid. Which is fine
because you are use to the Atari way of things. However, a new user may not
agree nor is a fact.

> Photoshop is probably more powerful than similar programs on

> for those for the Internet. Even here Atari software is improving
> and there is now an alternative to CAB.

You have not specify examples of equevelant apps. Much faster is too broad..
Are you stating that apps with a Falcon is faster than 200 mhz PowerMac which
are dropping rapidly in price..

As for CAB, I am sure anything is better. But the ST platform is always paying
catchup and not being the first with new innovation. Macs are cheap and will
be even cheaper as the weeks go by. With all these internet related apps and
the cheap hardware I can find hardly a case for the ST platform..

> I made a comment in my first post about the Atari allowing
> a user more control. Some examples are assigning programs

> to a key to launch, choosing a preference location
> for individual programs, setting file masks, moving and renaming
> files, and being able to eject a floppy.
> Just some additional thoughts.

You think that is exclusive on the ST? Ever hear of Macros, Quickkeys and
Alias? I can put Alias of apps anywere I please...I can put apps in my startup
sequence if I want..

Are you sure you have used a Mac?

Isn't Toad one of the last place that deals with the ST? Seems like is a popular place to do business with. I bought my Lynx from them..

Yep No problem, I mean, there arn't that many of us, I will just push the setee back and kick her and the kids out, plenty of room :)

> I've always wanted to try a pint of that stout English beer, too.

"stout"?, A good old pint of Bitter X 7 <BIG SMILE>

Cheers.....!ynoT

So? In what page of computer shopper or at what URL can you find these
alleged products. Furthermore, where can one find a Mac clone anywhere
in a retail establishment anywhere near the eastern seaboard?

Or is this claim like all of your others: quite a bit of hot air?
